## TENDER.

MARKET HARBOROUGH GAS COMPANY, LIMITED.

Directors of the above Company invite Tenders for the supply of 3,000 tons of fresh wrought screened GAS COALS, to be delivered during the ensuing Twelve Months.

Tenders for the supply of about 30 tons of SULPHURIC ACID.

Tenders to the Chairman by the 28th inst.

Particulars from the Manager,

J. FEVER.

## TENDER.

T A R.

Directors of the Reading Gas Company invite Tenders for the Purchase of their Surplus Tar for One Year, commencing on the 1st of June next.

Tenders for the contract will be forwarded on application.

Communication direct to the Works.

Endorsed "Tender for Tar," must be delivered not later than Monday, the 27th inst.

Place, Reading,  
May, 1896.

ARTHUR H. CANE,  
Secretary.

## ADVERTISEMENT.

OL and Chemical Manufacturing Works.—

Sold by Auction by Mr. G. H. Taylor, of Coddison, Taylor, & Booth, on the 2nd of June, all those Works in the occupation of Dan. Dawson Bros., and particulars in future advertisement. Full information can be obtained from Mr. J. F. DYSON, Huddersfield; from Mr. J. F. DYSON, New-  
field, or from Messrs. RAMSDEN, SYKES, & RAMSDEN, Solicitors,

## Notices.

Communications for the *Chemical Trade Journal* should be sent by Post Office Orders made payable to—

8 BROS., 32, Blackfriars Street, MANCHESTER.

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

## Advertisements.

Advertisements of Situations Vacant, Premises on Sale or To be Let, and Specific Articles for Sale by Private Contract are published in the *Chemical Trade Journal* at the following rates:—

10 Words and under .....

Each additional 10 words .....

Advertisements of Situations Wanted are inserted at one-half the rate when prepaid, viz:—

10 Words and under .....

Each additional 10 words .....

## CURRENT TOPICS.

### OXYGEN AS A RESTORATIVE.

THE use of oxygen as a restorative in cases of "gassing" and drowning is a matter of growing interest. In France its efficacy is apparently accepted as settled, and it is provided in some cases by the municipal authorities. In this country, however, there seems to be some doubt as to its reliability. So far, most of the complaints of those who do not think much of it have been mostly negative ones, but it may be reasonably presumed that the result obtained in connection with the recent colliery accident near Leeds will be used as evidence by those who belittle the value of oxygen. It is true that while there is one failure recorded, there are three or four successes; but it is necessary after the Leeds case to emphasise the importance of using the oxygen rightly.

Taking one thing with another, we cannot come to the conclusion that the indefinite results obtained with the man Whittaker, at Leeds, can be fairly taken as indicative of the unreliability of oxygen. In the first place, the case was a most desperate one and altogether incomparable with the circumstances under which efficacy is usually claimed for oxygen. The man was, so to speak, saturated with carbon dioxide and in an utter state of collapse. Though we have been to considerable trouble in the matter, we have not been successful in gathering very satisfactory evidence as to the way the oxygen was applied, and though we do not for a moment wish to impute anything derogatory to the two medical men who were present at the time, we feel justified in suggesting that better results might have been obtained had the oxygen been administered by a works manager, or some one familiar with the treatment of "gassing."

The result in this instance has emphasised the necessity of steps being taken to extend the knowledge of the correct use of oxygen, at all events in chemical and allied works. The question has been receiving attention in several districts where the employers are anxious to obviate the danger of gassing as far as possible. Concurrently we have for a considerable period been collecting all the information extant, with a view to codifying the same, and thus, as far as is feasible, making it possible to compare the results of future cases. In thus prematurely disclosing our intentions we afford an opportunity to all those with whom we have not been in communication of contributing towards the formulation of a consistent, practical, and trustworthy *modus operandi*.

### NITRATE FINANCE.

Though the nitrate world is the poorer for the loss of the familiar figure so long connected with the nitrate industry, things are by no means paralysed. The Anglo-Chilian Nitrate and Railway Company, Ltd., are busy with an endeavour to recoup themselves somewhat for the heavy expenses they have been put to during the development of

the company, and have this week offered an issue of £600,000. Four-and-a-Half per Cent. Consolidated Mortgage Bonds. In connection with this issue it is interesting as well as advisable to survey the past history of the company.

The original prospectus of the company contemplated the issue of £200,000. First Mortgage Bonds secured on the railway, pier, and water supply. These were fully subscribed, and were issued in due course.

In 1890, £150,000. Six per Cent. (grounds and works) First Mortgage Debentures were issued. These were secured by a first mortgage upon the 10½ square miles of nitrate grounds the company then possessed, and its single officina then in course of construction, and a second charge upon the property comprised in the mortgage for securing the railway bonds.

Since that time the company has acquired about eight square miles of additional nitrate grounds, another officina has been built, and the railway extended some 15½ miles and its equipment more than doubled. These extensions and additions to the railway were necessary for the proper development of the growing traffic of other officinas established in the district, and with which the railway has been connected. The cost of these works and of the new grounds with the necessary plant has, besides depleting the company's funds on this side, also involved the company in heavy interest and banking charges in Chili. The company now desires to recoup itself some of the cost thus incurred and to consolidate, at a lower rate of interest under a single first mortgage, its various loans, including £80,000. of Seven per Cent. Debentures issued at a temporary measure in 1895.

The profits for the last four years have shown an increase, and though the continuation of this cannot be expected in the face of the past year and its low prices, still a fair profit may honestly be looked for. Seeing that the present issue if fully taken up would require £33,000. to meet the interest, this is evidently well provided for, as the profit of 1892 would have been more than sufficient, compared with which the profits for 1893 and 1894 show that they doubled and then nearly trebled themselves. Taking the mean of the three years, therefore, to represent the probable profit for 1895, there is ample security for this new issue.

### SOCIETY OF CHEMICAL INDUSTRY.

THE following is the provisional programme for the annual general meeting, to be held in London, on Wednesday, Thursday, and Friday, July 15th, 16th, and 17th, 1896:—First day: 10 a.m., council meeting. 10-30 a.m., general meeting and president's address (in the Hall of the Carpenters' Company, London Wall). 2 p.m. visits to (a) Her Majesty's Mint, (b) the Tower Bridge. 9 p.m. Reception at the Mansion House by the Right Hon. the Lord Mayor. Second day: An excursion will be made on the River Thames from Reading to Windsor. A special train will leave Paddington Station, Great Western Railway, main line, at about 9-30 a.m. for Reading, whence launches, provided by Messrs. Salter Bros., of Oxford and Windsor, will convey the party to Medmenham, where luncheon will be served at the Abbey Hotel. After luncheon, progress will be made towards Windsor, near which tea will be provided. Tickets 12s. 6d. each person. From Windsor a special train will proceed to Paddington, arriving at about 8-30 p.m. Each member notifying his intention to attend, upon the form of completed arrangements which will be found in the May issue of the Journal, may apply for friends' or ladies' tickets in addition. Third day: By special permission members will visit (a) the Royal Arsenal, Woolwich, (b) the Siemens' Company's Telegraph Cable and Electric Construction Works at Silvertown. In the evening an informal dinner (tickets, including light wine, 10s. 6d.) will be held at the new Hotel Cecil. The only toasts will be those of the "Queen and Royal Family" and "The Society of Chemical Industry." These will be proposed during a smoking concert after dinner. The music will be

specially arranged for. Tickets, coupons, and information may be had, on and after June 1st, from the Secretary of the London Section, Mr. John Heron, c/o Society Chemical Industry, Palace Chambers, Westminster, S.W.

### NOTTINGHAM SECTION.

This section held their annual meeting on Wednesday, May 13th, at Nottingham, Mr. F. J. R. Carulla being in the chair. Mr. John White, F.I.C., of Derby, was amongst the visitors. The ballot resulted in the re-election of the present officers for the next session (1896-97)—chairman, Mr. F. J. R. Carulla; vice-chairman, Mr. J. M. C. Paton; treasurer, Mr. S. J. Pentecost; secretary, Mr. J. T. Wood; and of the following committee: Messrs L. Archbutt, R. M. Caven, Dr. F. Clowes, Messrs. H. Forth, W. G. Johnston, J. F. Kempson, F. E. Lott, T. Mason, Dr. J. J. Sudborough, and Messrs. C. Taylor, and G. J. Ward.—The Chairman read (in the unavoidable absence of the secretary) the annual report prepared on behalf of the committee, showing that the section is in an active condition, 18½ pages of the Journal of the society having been filled by its contributions during the last 12 months. "The total pages devoted to sectional matter in these numbers is 236, which divided by eight gives an average of 29½ for each section. Considering the smallness of our number, it is a matter for congratulation that we are close on two-thirds of the average."—Commenting on the report, Mr. Archbutt thought that the comparison made was hardly just enough to the section, which consisted of little more than 50 members, whilst the society as a whole had nearly 3,000.—The treasurer's annual report showed the section to be in a satisfactory condition financially.—On the motion of Mr. J. F. Kempson, seconded by Mr. G. J. Ward, the hearty thanks of the section were accorded to the College Committee for the use of rooms in University College, a privilege that is very highly valued and appreciated.—Mr. L. Archbutt then read an important paper on "An evaporation test for cylinder oils," describing an apparatus which he had devised for the rapid estimation of the constituents of oils that are volatile at the temperatures to which they are exposed in use. The author finds that this result varies from less than 0.5 per cent. to 18 per cent., and is thus able to obtain quickly a quantitative as well as qualitative estimate of the practical value of the oil with less trouble than by the usual test of the flashing point.—The paper was discussed by Dr. Clowes, Messrs. Caven, Paton, Ward, and others.—A discussion then followed on the chairman's recent note on "The corrosion of iron by crude tar," Dr. Clowes expressing doubts as to the corrosive action being due to the presence of carbolic acid in the tar.—Mr. Ward mentioned that galvanised sheets corroded rapidly if coated with tar.—Mr. White questioned the accuracy of the inference drawn from a case mentioned in the note that ammonium chloride was the cause of corrosion. There was a general agreement that the subject, whilst of much practical importance, was involved in some mystery, and deserved further investigation by members who had the opportunity.—Notice was given that the June meeting will be devoted to the subject of acetylene, when one of the communications will be by Dr. Clowes. The next agenda paper will also contain a question to which replies are requested as to the amount of total air usually found in the waters of rivers and canals, and which is given off in vacuo. This is an important matter to the makers and users of pumps for town supplies and other purposes.

### STANDARDISING NORMAL ACID WITH BORAX.

By FRANCIS BERGAMI.

MORE than thirty years ago, Th. Salzer recommended the use of borax for the alkalimetric measurement of acids, but his proposition attracted very little attention until E. Rimbach published his work on the determination of the atomic weight of boron. Since that time, several other chemists have tried to introduce the use of borax for the standardising of normal acid, but they all propose either methyl orange or litmus as indicators for this purpose. Mr. L. F. Kebler stated some time ago, before the Chemical Section of the Franklin Institute, that methyl orange proved to be of inferior value in his hands, as well as in the hands of other chemists. Litmus enables one to obtain satisfactory results, but it requires a great deal of practice, as the change of colour in borax solutions is not as distinct as could be desired for routine work, especially by inexperienced workers. I am, therefore, surprised that so little attention seems to have been paid to the researches of Robert T. Thomson, on larmoid.

Thomson found that larmoid, while its properties as an indicator are nearly the same as those of methyl orange, excels the latter substance by far in regard to sensitiveness, and allows an absolutely correct titration of the alkali in borax solution. A double recrystallisation of the commercial c.p. borax yields a strictly pure product, and, by the aid of this and larmoid as indicator, the standardising of normal acid becomes not only a very convenient, but also an extremely accurate operation.

## The Patent List.

*It is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of J. Davis and Alfred R. Davis, who report professionally on the value of Chemical Patents.*

### ACTS OF LATEST COMPLETE SPECIFICATIONS.

*Abstracts are specially prepared for the Chemical Trade Journal, and the rights of publication are reserved. This is the earliest abstracts of Chemical and allied patents accessible to the*

*Abstracts in Electrolytic Processes and Apparatus Therefor.* G. B. Trieste, Austria. Eng. Pat. 5,098. March 6, 1895.  
 The invention relates to an apparatus for electrolysis sea water in such a manner that the caustic soda formed is collected in one porous vessel and the magnesium and calcium oxides in another. These collecting vessels are so constructed that one simultaneously forms the anode and the other is of such a shape as to conveniently hold the cathode which is of carbon. For particulars of the cells the eight figures should be consulted.

*Improvements in Apparatus for Treating Paper Pulp.* L. Naeyer, Leek, Belgium. Eng. Pat. 12,461. June 27, 1895.  
 The improvements are of a purely mechanical nature. A rectangular vessel is divided into three longitudinal chambers by two perforated partitions. The two outer chambers are provided with stirring blades, and force the pulp through the partitions into the central chamber in which the purified pulp collects, and is removed by suitable means. There are two drawings.

*Improvements in the Manufacture of Sulphate of Lead and Lead Oxide.* H. R. Gregory, 5, Amerland-road, Wandsworth. Eng. Pat. 11,185. May 18, 1895.

The process for producing sulphate of lead a quantity of galena in a state of division is thoroughly mixed with a suitable quantity of an alkaline earthy magnesian carbonate. This mixture is roasted at a low red heat in a retort or furnace, with occasional stirring, until all the sulphur is indicated by the mixture assuming a light brown colour. The roasted mixture is diluted to the consistency of cream, in cold water. Sulphuric acid is added, and the whole washed with soluble matter. The residue is mixed with large excess of water, and the solution is filtered. The filtrate is concentrated in closed boiling pans fitted with agitators. When at about the consistency of caustic soda is added, and the agitation and boiling continued.

Eventually the whole is allowed to settle and the clear liquid is decanted off. The insoluble residue contains the lead as hydrated oxide, and is recovered by dilute nitric acid is added in more than sufficient quantity to convert all the lead into nitrate, which salt is finally decomposed by sulphuric acid, and the precipitated sulphate of lead washed with water.

The process may be shortened by treating with nitric acid, immediately after the first treatment with sulphuric acid. The residue obtained by the full process, however, is claimed to be better adapted for pigmentary purposes.

*Improvements in or Partitions for Electrolytic Purposes formed of Carbonaceous or Alkaline Earths.* S. S. Bromhead, 92, Newgate-street, London. (Communicated by La Soc. Anon des Anciennes Salines Domaniales de l'Actien Gesellschaft, Dienne, Lothringen, Germany.) Eng. Pat. 11,185. December 12, 1895.

The object of the invention is to overcome the difficulties that have always surrounded the maintenance of a suitable osmotic diaphragm for electrolytic purposes. It is made in the direction of employing alkaline earths. The diaphragm is shaped by mechanical means to form pots, plates, and is of a particular material has been found specially suitable for the electrolysis of alkaline chlorides, the well-known action of chlorine gas on finely divided chalk.

*Ozone Compounds for Medicinal Purposes.* E. Langheld, 16, Sophien-Charlotten-strasse, Charlottenburg, Germany. Eng. Pat. 5,672. March 17, 1896.

This patent does not deal with any applications of ozone that appeal to the interest of the chemical trade. It merely deals with a simple method of preparing ozonised solutions of quinine salts or animal oils, such as cod liver oil.

## Parliamentary Notes.

### LOCOMOTIVES ON HIGHWAYS BILL.

In the House of Lords, on Tuesday, the House went into Committee on this Bill.

Lord Harris moved to amend Clause 1 by substituting four tons for two as the *maximum* weight of unladen vehicles exempted from enactments restricting the use of locomotives on highways. He remarked that the President of the Local Government Board had agreed to make this amendment in deference to representations which had been made to him.

Lord Thring agreed that the *maximum* weight of unladen vehicles should be raised, but he suggested that some limit should be placed on the load that the vehicle might carry, and that there should be flexibility in the Bill to encourage inventions for distributing the weight between two vehicles.

The Earl of Kimberley said no doubt many improvements would be made in the development of these vehicles, and power should be given to make bye-laws, as to weight and width of wheel (subject to the consent of the Local Government Board and the Secretary of State), to meet unexpected changes and inventions.

Lord Harris said, with regard to weight, the erection of a large number of weighing machines would be necessary all over the country, and obviously in London, and it would be ridiculous to expect carriages carrying persons to be weighed whenever a policeman or some one else demanded it. He did not think Lord Thring's suggestion was a practical one. His instructions were to adhere to the *maximum* weight of carriage unladen and not to refer to the weight of a loaded carriage. The other points alluded to he would bring under the attention of Mr. Chaplin. But he would ask their lordships to accept the Bill now, as he was not empowered by Mr. Chaplin to accept any suggestions at present for further amendments in the Bill.

The amendment was then agreed to.

Lord Harris then moved to omit the latter part of the clause and insert the following:—“(a) Section 26 of the Highways and Locomotives Amendment Act, 1878, shall apply to light locomotives as if they were drawn by animal power, and as so applied shall extend to London; (b) a light locomotive shall be deemed to be a carriage within the meaning of any Act of Parliament, whether public, general, or local, and of any regulation made under any Act of Parliament, and, if used as a carriage of any particular class, shall be deemed to be a carriage of that class, and the law relating to carriages of that class shall apply accordingly.” Lord Harris said the principle of section 26 of the Highways and Locomotives Amendment Act, 1878, had been extended by section 41 of the Local Government Act, 1888. The former section empowered local authorities to make various regulations as regarded width of wheel, skids going down hill, and other matters. It had been pointed out that the clause was not clear as to the law that would apply. It was considered doubtful whether the Inland Revenue could levy a tax for this class of carriage, and the clause had been amended to make it perfectly clear that, whatever the kind of carriage might be, and whether the Act of Parliament was a public, general, or local Act, the Act and any regulations under it would apply to these carriages.

The clause, with the proposed amendment, was agreed to.

Lord Harris moved to amend Clause 2, which regulates the keeping and use of petroleum, or any other inflammable liquid, by substituting £10. for £2. as the fine for any breach of the regulations. He remarked that it had been considered that a penalty of £2 was not sufficient, and that it was desirable to make it heavier.

The clause, with this amendment, was agreed to.

Lord Harris moved to omit from the Bill Clause 3, which provided a penalty of £10 for negligently driving a light locomotive or suffering it to be without due control. He said that the statutory provisions which the House had approved in Clause 1 rendered this clause unnecessary, for the ordinary law as regarded negligent and furious driving would apply as much to locomotives as to any other kind of vehicle.

The omission of the clause was agreed to.

Clause 4, which provided that the Local Government Board may make regulations for the use of light locomotives and a fine of £10. may be inflicted for any breach was also agreed to, as well as the insertion, after Clause 4, of certain new clauses of a consequential character.

The Bill then passed through Committee.

## Official Memoranda.

(From the Board of Trade Journal.)

### ARGENTINE REPUBLIC CUSTOMS LAW.

The following is an abstract of the present import duties:—

|                                                   |                 |
|---------------------------------------------------|-----------------|
| Borax .....                                       | 4 % ad valorem. |
| White Lead .....                                  | 10 "            |
| Anhydrous Ammonia .....                           | 10 "            |
| Sulphate of Baryta .....                          | 10 "            |
| Coal Tar and Pitch .....                          | 10 "            |
| Dégras .....                                      | 10 "            |
| Sulphate of Lime .....                            | 10 "            |
| Flowers of Sulphur .....                          | 5 "             |
| Heavy Tar Oils .....                              | 5 "             |
| Mercury .....                                     | 5 "             |
| Resin .....                                       | 5 "             |
| Nitrate of Potash (crude) .....                   | 5 "             |
| China Clay .....                                  | 5 "             |
| Soda Crystals .....                               | 5 "             |
| Soda Ash .....                                    | 5 "             |
| Nitrate and Sulphate of Soda .....                | 5 "             |
| Silicate of Soda .....                            | 5 "             |
| Caustic Soda .....                                | 5 "             |
| Sulphate of Alumina .....                         | 5 "             |
| Cocanut, or palm oil .....                        | \$0 05 cents.   |
| Farina .....                                      | 0 05            |
| Common salt .....                                 | 0 02            |
| Fine salt, in kegs .....                          | 0 01            |
| Kerosene .....                                    | 0 01½           |
| Candles of Stearine, Paraffin, and Mixtures ..... | 0 10            |

### IMPORTATION OF AMMONIA INTO UNITED STATES.

A communication has been received at the Foreign Office from Mr. A. G. Vansittart, Her Majesty's Consul at Chicago, stating that a considerable amount of ammonia is being imported by the packing houses established in Kansas City and throughout the West for freezing and cooling purposes.

It appears the demand exceeds the American supply. As these houses must keep a large supply ahead, one important firm in Kansas City has contracted for a whole year's supply of ammonia to come from Berlin.

### CANADIAN WOOD-PULP INDUSTRY.

The *Canadian Gazette* states that the Dominion Government has now under consideration a proposal which has often been urged upon Canada for an export duty of two dols. per cord upon pulp wood, so as to discourage the export of the raw material from Canada, and encourage its manufacture into pulp in Canadian mills. At present the United States tax on imported pulp is ten per cent., while pulp wood is free. A Canadian export duty would, it is claimed, induce the United States to remove their duty; this the Canadian Association think would give them control of the trade. At present Canada exports about 500,000 cords of pulp wood yearly, so that the proposed export duty would, it was said, yield a revenue of 1,000,000 dollars annually. The exporters of pulp wood, of course, object to such an impost. As it is, they have their hands full, they say, to compete with the pulp wood sellers of Virginia and Maine.

On the face of it, Canada is wise to encourage her own manufacturers. Her exports of the raw material, *i.e.*, pulp wood, practically all of which goes to the United States, have been as follows:—

|             | Dols.   |
|-------------|---------|
| 1890 ... .. | 108,998 |
| 1891 ... .. | 219,458 |
| 1892 ... .. | 386,092 |
| 1893 ... .. | 392,262 |
| 1894 ... .. | 468,359 |

Which shows a constantly increased export of raw material. The pulp wood exported in 1894 would be capable of producing mechanical pulp to the value of £400,000. sterling, or about five times the value of the pulp wood now exported. If converted into chemical pulp the export value would be no less than £700,000. sterling.

As it is, Canada is doing an increasing export trade in pulp as well as in the wood. The exports of pulp stand thus:—

|             | Dols.   |
|-------------|---------|
| 1890 ... .. | 168,180 |
| 1891 ... .. | 280,619 |
| 1892 ... .. | 355,303 |
| 1893 ... .. | 455,893 |
| 1894 ... .. | 547,217 |
| 1895 ... .. | 590,874 |

Showing also again a steady annual increase.

The British demand for wool pulp is largely on the increase. The imports for 1895, for example, were of the value of £1,574,400 (297,098 tons), an increase of £150,000. over 1894.

There is a further stage to which Canadian mills should carry the wood-pulp business, namely, to the stage of paper manufacture. The United Kingdom imported last year unprinted paper to the value £2,046,106, and strawboards, mill-boards, and wood-pulp boards to the value of £548,254. The exports of paper from the United States were last year of the value of about £500,000. sterling. Canada, with her forest resources and unlimited water power, should certainly take her place in the business. At present Great Britain looks chiefly to Germany, Holland, Sweden, and Belgium for her imported unprinted paper.

### THE CHAT MOSS REFUSE WORKS.

COLONEL J. O. HASTED, inspector of the Local Government Board, held an inquiry at the Town Hall, Manchester, recently, with reference to an application by the Manchester Corporation for power to borrow £55,000. for the execution of works on the Chat Moss estate. Mr. Thomas Hudson, deputy town clerk, appeared on behalf of the Corporation, and Mr. J. H. Boardman, solicitor, watched the inquiry for the Manchester, Salford, and District Property Owners' Association.

Mr. Hudson said the inquiry was a supplemental one, the matter having been fully investigated at an inquiry held by the late Mr. S. J. Smith, in May, 1893. On that occasion a large number of witnesses were examined in support of the proposal, and evidence in opposition was given by representatives of the Barton-upon-Irwell Rural Sanitary Authority and other authorities. Application was at that time made for the borrowing of a sum of £200,000., and the Local Government Board sanctioned the borrowing of £145,000., which represented the estimated cost of the land and the expense of laying it out. The Board gave its sanction on the understanding that the City Council was prepared to carry out the necessary works to furnish a sufficient supply of water for the farms and dwellings on the estate. The Local Government Board further stated, in the letter in which it gave its sanction to the borrowing of the £145,000., that it deferred consideration of the works proposed to be erected on the estate until the detailed plans and estimates had been prepared. With regard to the water supply, the Corporation had not yet completed that supply, the intention being that this should be done as the homesteads were restored. Many of the houses were in a bad condition, this being due, as he understood, to the fact that Chat Moss had been held under a lease for 99 years, and that that lease was on the eve of expiration. When the lease had expired and the Corporation took possession, it was proposed to put the buildings in a proper state of repair, and when that was done a supply of water would be provided. Of the £145,000. borrowed, a sum of £5,600 had not yet been expended, and it was proposed to use this for the purpose of the water supply. As to the other works now in contemplation, the Local Government Board had itself urged the Corporation to go on with the works, so that it was not anticipated that there would be any difficulty now.

Mr. Boardman said it might simplify matters if he explained that he did not propose to offer any opposition.

Mr. John Richards, chairman of the Cleansing Committee of the Corporation, gave details of the works which are considered necessary in treating and disposing of the refuse sent out from the city to Chat Moss. The chief item in the £55,000. is a sum of £21,500. for the erection of sixteen new homesteads to replace certain houses which were at present in a very dilapidated condition, and for the restoration of such of the existing houses as may be considered worth being dealt with in this way. Those houses are to be tenanted by labourers on the estate. Another item is £8,000. for a light railway which is to be carried over the estate and down to the dock which it is proposed to construct at Boysnope on the Ship Canal under an agreement which has been come to with the Manchester Ship Canal Company. The other works include a light portable railroad, a system of drainage to take the place of the present open drains, offices, workshops, and stables near the Boysnope dock, and a post and rail fence to enclose such parts of the estate as are unenclosed or dangerous.

Mr. R. D. Callison, indoor superintendent of the Cleansing Department of the Corporation, and other witnesses were afterwards examined.

At the close of the inquiry the inspector paid a visit to Chat Moss.

ALKALINE REDUCTION SYNDICATE.—The hearing of the application on behalf of the liquidator of the Alkaline Reduction Syndicate, Limited, to settle the list of the contributories was resumed on Saturday last by Mr. Justice Vaughan Williams, sitting in the Companies (Winding-up) Court as an additional Judge of the Chancery Division. By the motion the court is asked to settle on the list of 16 gentlemen who dispute liability. The hearing was again adjourned.

## THE MINERAL PRODUCTION OF THE U.S.A.

THE following interesting particulars of the production of minerals in the States during 1895 are given in the advance sheets of Mr. R. P. Rothwell's excellent annual compilation of "Mineral Statistics":—

|                                                 | 1894.      | 1895.      |
|-------------------------------------------------|------------|------------|
| Alum, short tons .....                          | 72,000     | 75,000     |
| Antimony ore, short tons .....                  | 165        | 1,083      |
| Asbestos, short tons .....                      | 265        | 1,010      |
| Fibrous talc, short tons .....                  | 50,500     | 66,500     |
| Talc and soapstone, short tons .....            | 21,044     | 18,885     |
| Asphalt, short tons .....                       | 4,198      | 14,300     |
| Bituminous rock, short tons .....               | 34,199     | 43,778     |
| Barytes, short tons .....                       | 23,758     | 20,255     |
| Bauxite, long tons .....                        | 10,732     | 14,145     |
| Borax, pounds .....                             | 13,140,584 | 13,506,356 |
| Bromine, pounds .....                           | 379,444    | 394,854    |
| Cement, natural hydraulic, bbls., 300 lbs. .... | 7,813,766  | 7,694,053  |
| Cement, Portland, bbls., 400 lbs. ....          | 611,229    | 749,059    |
| China clay, short tons .....                    | 24,552     | 30,910     |
| Cobalt oxide, pounds .....                      | 6,550      | 6,400      |
| Copperas, short tons .....                      | 14,897     | 14,118     |
| Copper sulphate, pounds .....                   | 60,000,000 | 45,000,000 |
| Graphite, pounds .....                          | 770,846    | 392,008    |
| Graphite, amorphous, short tons .....           | 165        | 1,100      |
| Gypsum, short tons .....                        | 301,536    | 298,572    |
| Lime, bbls., 200 lbs. ....                      | 56,750,000 | 60,000,000 |
| Magnesite, short tons .....                     | 1,370      | 2,200      |
| Mica, ground, pounds .....                      | 829,500    | 750,000    |
| Paints, mineral, short tons .....               | 47,593     | 47,084     |
| Paints, vermilion, short tons .....             | 91         | 118        |
| Paints, white lead, short tons .....            | 87,242     | 92,000     |
| Paints, zinc oxide, short tons .....            | 22,814     | 22,690     |
| Petroleum (crude), bbls., 42 gals. ....         | 48,527,336 | 50,652,025 |
| Phosphate rock, long tons .....                 | 952,155    | 831,498    |
| Pyrites, long tons .....                        | 107,462    | 81,000     |
| Salt, evaporated, bbls., 280 lbs. ....          | 11,798,659 | 12,521,498 |
| Salt, rock, bbls., 280 lbs. ....                | 2,341,922  | 1,367,638  |
| Sulphur, long tons .....                        | 441        | 12,000     |
| Aluminum, pounds .....                          | 817,600    | 900,000    |
| Antimony, short tons .....                      | 220        | 433        |
| Lead, short tons .....                          | 160,867    | 156,854    |
| Quicksilver, flasks, 76½ lbs. ....              | 30,440     | 33,978     |
| Zinc spelter, short tons .....                  | 74,004     | 81,858     |

**LEAD.**—The production of lead from domestic ores in 1895 showed a decrease from the previous year. It amounted to 142,298 metric tons (156,854 short tons), a decline of 2.5 per cent. This was due to the very large quantity of lead smelted from foreign ores or refined from foreign bullion, the total consumption showing a considerable increase. The details of production and consumption are shown in the following table:—

| PRODUCTION OF LEAD IN 1895.         |                       |                 |
|-------------------------------------|-----------------------|-----------------|
| Production:                         | Tons of<br>2,000 lbs. | Metric<br>tons. |
| Desilverised .....                  | 119,057               | 107,985         |
| Non-argentiferous .....             | 32,797                | 29,747          |
| Antimonial .....                    | 5,000                 | 4,535           |
| Total, domestic .....               | 156,854               | 142,267         |

|                                     | 37,105                | 33,654          |
| Consumption .....                   | 232,881               | 211,223         |

**QUICKSILVER.**—There was a marked increase in production in 1895, the total being 1,219 metric tons (35,122 flasks), against 1,056

metric tons (30,440 flasks) in 1894. The metal was entirely from the California mines, no new sources of production having been developed during the year.

**ZINC.**—The total production of spelter, or commercial zinc, in 1895 was 74,245 metric tons (81,858 short tons). The year was marked by an extension of mining and of output to an extent greater than the consumption, resulting in continued low prices. With the present abundant supply these may be expected to continue until new uses are found for the metal and the demand is correspondingly enlarged; unless indeed, the combination which now controls a large part of the production of spelter should attempt to advance prices above 4 cents per pound, when a further restriction in consumption might be expected.

**ALUM.**—The growth of this industry is steady and satisfactory, as is shown by the large production. Some alum is made from imported bauxite and other materials, including cryolite, which is not produced in this country.

**ASBESTOS AND TALC.**—The output of asbestos showed a considerable increase in 1895, chiefly due to the working of mines in Georgia, which have been opened within the past two years. We still continue to import a large part of our supply. The output of fibrous talc was increased to meet a growing demand; it all comes from a limited area in New York, where the mines are actively worked under a combination. The production of talc and soapstone declined slightly.

**ASPHALT.**—The asphalt and bituminous rock reported are chiefly from California. The gilsonite deposits of Utah are not actively worked, owing to difficulties of transportation. The use of asphalt in the United States is rapidly extending, but the chief reliance is on imported material, the island of Trinidad furnishing the largest part of the supply.

**BARYTES.**—There was a slight decrease in this mineral, coupled with an increase in its value.

**BAUXITE.**—A considerable increase is reported, due to the organisation of new companies and the opening of new beds in Georgia and Alabama. No other deposits have been worked.

**BORAX.**—No change in production or methods is to be reported. The output—wholly from California and Nevada—shows a slight increase.

**BROMINE.**—Only slight changes are noted, with no difference in methods.

**COBALT OXIDE.**—The small production showed little change in its amount or sources.

**COPPERAS.**—But little change is reported, but there was a decrease in prices and values.

**COPPER SULPHATE.**—This is an important product, and our exports last year to Europe and Mexico reached a considerable figure.

**FLUORSPAR.**—The single producing mine in Illinois showed a decrease, this being one of the few products which declined in amount.

**GRAPHITE.**—No new developments have been made and the home production is still chiefly controlled by a single interest.

**MAGNESITE.**—The production in 1895 showed a total of 1,995 metric tons (2,200 short tons). It is derived from the California deposits entirely, and the production increases slowly as the use of the material extends.

**MICA.**—The production of 343 metric tons (38,356 pounds) continues to come chiefly from New Hampshire and North Carolina. Some new deposits in Idaho are being developed.

**MINERAL WOOL.**—We have introduced this product for the first time, its manufacture from blast furnace slag representing the partial utilisation of material formerly wasted. There were 6,115 metric tons (6,742 short tons) made in 1895.

**MONAZITE.**—The special demand for this mineral continues to increase, and the total reached 862 metric tons (1,900,000 pounds), or much more than double that of 1894.

**MINERAL PAINTS.**—An increased demand is apparent in the figures of the table. The largest gain is in white lead, of which in 1895 there were 83,462 metric tons (92,000 short tons) of "dry" produced.

**PHOSPHATES AND MARLS.**—The output of mineral fertilizers for domestic use showed some increase, but owing to the diminished exports the total production of phosphate rock fell off both in quantity and in value. The cause of the smaller sale abroad is found to be in part the opening up of the deposits of phosphates in Tunis and Algiers, and in part the use of other sources of phosphoric acid, such as the Thomas slag from the basic steel process.

**PYRITES.**—The total production, chiefly used in the manufacture of sulphuric acid, was 82,296 metric tons (81,000 long tons), showing a decrease from 1894, largely due to the cheapness of imported supplies.

**SALT.**—Of the minerals necessary to existence, salt shows an increase a little greater in proportion than the normal growth of our population, due to our growing chemical industries, and that demand may be expected to continue increasing, as those industries are developed on a scale approximating the growth which they have already attained in Europe.

## ESTIMATION OF SULPHUR IN PYRITES.

A RECENT contribution to the controversy between Mr. Gladding and Dr. Lunge has been made by the former in a communication to the *Journal of the American Chemical Society*. The earlier portions of the discussion appeared in our back numbers (vide C.T.J., Nos. 384, 408, 416, and 440). Mr. Gladding now takes up the thread of the discussion where it was dropped by Dr. Lunge. He says:—In October, 1895, Dr. Lunge continued the discussion of the estimation of sulphur in pyrites. He presents no new experimental support of his position. He indirectly accuses me of having published a "private" communication without the sanction of the writer, Prof. Richards. In reply, I will say that the words of Prof. Richards were published by myself, not only with full permission, but after a careful revision of the same by their author. Had Dr. Lunge addressed a note to Prof. Richards or to myself, he would have been saved from making a most unkind and needless accusation.

While Lunge attempts no further support of his position by chemical experiment, he makes the claim that any occlusion of barium chloride that occurs is compensated for by the solubility of barium sulphate in the acid liquor of precipitation. In his own words "my claim has been that my method by compensation of unavoidable errors, gives correct results."

I have investigated this claim of Lunge's, as far as it applies to the occlusion of barium chloride in his method, in the following manner:—I have had one of our assistants repeat the work with chemically pure sulphate of ammonia, using two grams in each case, making comparison precipitations with a 10% solution of barium chloride, the first by adding the barium chloride solution drop by drop from a burette, the second by sudden addition from a small beaker in which it had been brought to the boiling point. The results were as follows:—

|               | By slow addition. | By sudden addition. |
|---------------|-------------------|---------------------|
|               | Gram.             | Gram.               |
| Sulphur ..... | 0.4840            | 0.4880              |
| Sulphur ..... | 0.4820            | 0.4873              |

These experiments show an occlusion of about 0.040 gram barium chloride and a corresponding error of 0.50 to 0.55% in the estimation of the sulphur present.

I repeated personally the second series of precipitations obtaining:—

|         | Barium sulphate obtained. | Sulphur. |
|---------|---------------------------|----------|
|         | Grams.                    | Gram.    |
| 1 ..... | 3.5480                    | 0.4878   |
| 2 ..... | 3.5430                    | 0.4871   |

These experiments show an error of about 0.55% in the estimation of sulphur present. The greatest care was taken in washing these precipitates. Three washings by decantation, using seventy-five cc. of hot water each time, were followed by five washings on the filter paper.

I now fused these precipitates with chemically pure sodium carbonate, dissolved the flux in water, filtered from barium carbonate, acidified the filtrate with nitric acid, added silver nitrate and from the silver chloride obtained, calculated the equivalent of barium chloride. I obtained in one case 0.0552 gram silver chloride, corresponding to 0.040 gram barium chloride; in the other, 0.0500 gram silver chloride, equivalent to 0.0364 gram barium chloride. Deducting these figures we have:—

|                                       |        |        |
|---------------------------------------|--------|--------|
| BaSO <sub>4</sub> .....               | 3.5480 | 3.5430 |
| BaCl <sub>2</sub> .....               | 0.0400 | 0.0364 |
| Pure BaSO <sub>4</sub> obtained ..... | 3.5080 | 3.5066 |

The sulphur obtained from these corrected results are 0.4823 gram and 0.4821 gram. These corrected results agree very closely with those obtained by our assistant when using the dropping method. I now fused one of the precipitates obtained by the dropping method with sodium carbonate in the same way, and obtained 0.0027 gram silver chloride, equivalent to 0.002 gram barium chloride. This shows that the occlusion of barium chloride is practically avoided by adding the barium chloride drop by drop, as 0.002 gram barium chloride would cause an error of only 0.026% in sulphur.

I now took up the question of the solubility of barium sulphate in the acid liquor of precipitation, imitating the conditions under which the actual analysis of pyrites is made. To 400 cc. water were added fifteen cc. strong ammonia. Hydrochloric acid was now added to acidify. To two such preparations I added 0.020 gram and 0.040 gram chemically pure ammonium sulphate, respectively. The solutions were brought to the boiling point and ten cc. barium chloride added. The liquid was boiled till clear and allowed to settle. I obtained:

|         | Barium sulphate. | Sulphur obtained. | Sulphur present. |
|---------|------------------|-------------------|------------------|
|         | Gram.            | Gram.             | Gram.            |
| 1 ..... | 0.034            | 0.00468           | 0.00484          |
| 2 ..... | 0.069            | 0.00949           | 0.00969          |

The sulphur lost by the solubility of the barium sulphate in the acid solution in the above experiments amounts to 0.016 and 0.020% respectively.

The above work demonstrates conclusively that the method employed by Lunge of adding the barium chloride all at once causes an error of about 1% in the percentage of sulphur, and that such error is not compensated for by the solubility of barium sulphate in the liquor of precipitation, as such solubility is very slight, causing an error of less than 0.03%.

In his first reply (March, 1895), Dr. Lunge objected to my method of estimating the 0.20 to 0.40% of sulphur (that may be left in the ferric hydroxide), by the simple process of dissolving the latter in dilute hot hydrochloric acid, adding ten cc. of barium sulphate solution and letting stand over night. This he declared was wrong, owing to the solubility of barium sulphate in such solution. I showed by a few simple and rigid experiments that I was entirely right. These experiments were very easily capable of repetition. But Lunge did not choose to repeat them. The above experiments showing that the sudden addition of barium chloride will cause an error of several tenths of a percent. are likewise very easily repeated, and the separation of the occluded barium chloride as described, is so positive as to the error caused by Lunge's method of procedure, that I hope for a further answer from Dr. Lunge. On account of the commercial importance of an accurate estimation of sulphur in pyrites, I have no doubt that a prompt repetition of my work as described above will soon be published by some other analyst, and the main point at issue, namely, the necessity of a very slow addition of the barium chloride solution, be settled.

## MOENANIA-LITHOPONE WHITE.

BY PAUL SCHUELLER.

LITHOPONE white is a pigment which is, of late, being used more and more in preference to other colours. It is well known that there is a great difference in the Lithopone of various makers, and, for this reason, no Lithopone white should be bought without first knowing its source of origin.

The Chemical Works, Moenania (for which Messrs. Schmitz-Jérôme and Knopff, of Hanover, are the sole representatives for exportation), are producing a snow-white and non-poisonous Lithopone white, which possesses a very high covering power, and mixes advantageously with other colours. Practical trials have proved the superiority of the Moenania-Lithopone in regard to body. For instance, for painting 100 square metres the following quantities of colour have been used:—

|                            |         |
|----------------------------|---------|
| White lead .. .. .         | 43 lbs. |
| Zinc white .. .. .         | 37 "    |
| Moenania-Lithopone .. .. . | 28 "    |

This is a very fair result. Besides this saving of material, there is the price of Moenania-Lithopone to be considered, this white being 15 to 20 per cent. cheaper than white lead, while it gives a most elastic and durable coat, which retains its original brightness, even in the presence of sulphurous acid. It is generally known that the sulphurous acid developed by fires and gas in living rooms affects white lead paint, and turns the same into lead sulphide, which has a nasty appearance. This will never occur where Lithopone white has been used, provided it has been ground in a pure oil (linseed oil, containing siccatives free from lead, being most suitable).

Lithopone white is also used for enamelling purposes, and in the manufacture of india-rubber goods, oilcloth, etc.

It will be apparent from the above that Moenania-Lithopone merits the full consideration of the trade as an excellent permanent white.

THE SANITARY INSTITUTE.—The council have accepted an invitation from the city and county of Newcastle-upon-Tyne to hold a Sanitary Congress and Health Exhibition in that city in the autumn of this year.

TRADE MARKS IN EGYPT.—The Board of Trade have received information through the Foreign Office that it is possible to register trade marks at the Registry of the Mixed Tribunals in Egypt. A certain advantage is found to accrue from such registration in the event of legal proceedings having to be taken for infringement. The Board of Trade desire, therefore, to press on the attention of those of Her Majesty's subjects who may desire, or intend, to engage in trade with Egypt, the necessity of promptly securing registration of their trade marks in Alexandria. In a trade mark case decided on the 18th of April last by the Court of First Instance at Alexandria, the judgment laid down that the plaintiff was not entitled to the publication in the newspapers of the judgment given in his favour at the expense of the defendant, as, although he had registered his mark, yet he had neglected to make such registration known to the public, both commercial and private, in Egypt, through the medium of the press. We understand that this question has been occupying the attention of the British Chamber of Commerce in Egypt, and that of one of their honorary legal advisers, Mr. J. E. Marshall, barrister-at-law.

## REVERTED PHOSPHATE.

CIPITATED, reduced, or reverted phosphate, any of these three titles being employed to signify the same substance, is a constituent of such importance to manufacturers and purchasers of fertilisers that a brief consideration of the distinctions between it and soluble phosphate on the one hand, and undissolved, or, more commonly called, insoluble phosphate of these manures, on the other, becomes unquestionably eminently desirable.

Reverted phosphate, then, consists of phosphate which has originally been rendered soluble by the sulphuric acid used in the process of preparation, but subsequently owing to the various reactions, has once again taken a form that is not capable of dissolving in water. Consequently, should probably readily infer, the proportion discovered in made samples can never amount to any very material quantity; percentage, however, occurring in pure dissolved bones, dissolved impurities, and similar products in the condition they are usually in commercially, that is to say, of course, after having undergone a reasonable period of storage, is not unfrequently sufficiently large to appreciably affect their market value, a statement acquiring a forcible emphasis when articles of superior quality are compared with those whose soluble phosphate is peculiarly liable to the modification mentioned.

Any obvious outcome of the foregoing facts must be that a specimen of pure dissolved bones, for example, guaranteed to contain some percentage of soluble phosphate, and, at the time of manufacture amply complying with the requirements, may, if kept for some months, on account of taking place, quite possibly afford when again analysed, a result seriously below the desired standard, thus furnishing the buyer with ground for complaint, because as he had bargained for soluble phosphate, evidently reverted phosphate cannot be substituted for it, such a stipulation has been expressly agreed upon, although the circumstances suggested we might reasonably consider the product possessed a practical value almost equal to any it ever had.

No doubt the always more or less marked tendency of soluble phosphate in manures to "go back" will be regarded as a decidedly undesirable attribute by everyone interested; yet concerning the matter already noticed, we can only accept as inevitable an action closely associated with the use of indispensable raw materials, for it is absolutely unpreventable by any known means. When, therefore, we proceed to speak of mineral superphosphate, we speedily find that the cases are not altogether parallel, because with reference to the latter product, the drawback can in very great measure be overcome by a judicious selection of ingredients and skilful preparation. Substances through whose influence the transformation in soluble phosphate is brought about are chiefly oxide of iron, alumina, organic undissolved phosphatic materials, and carbonate of lime. In these matters, as we have already pointed out, manifestly cannot be excluded, but this remark does not apply to the exceedingly insoluble oxide of iron and alumina, which, unlike nitrogenous matter, for instance, are virtually unendowed with fertilising qualities of their own, and, moreover, are particularly apt to induce the action of soluble phosphate; therefore, we perceive immediately why raw materials containing a relatively excessive amount of these compounds are carefully avoided by manure manufacturers, and, early enough, were such ingredients employed, it would be impracticable to give a warranty of percentage composition, or to do business with any degree of confidence.

We are now instinctively led by our reflections to endeavour to compare the comparative agricultural value of reverted phosphate. Evidently, as the preceding observations must unmistakably demonstrate, it is totally different from soluble phosphate, and while unexpressing our opinion regarding its superiority over insoluble phosphate, which never has been soluble, and also contending that good manure, which owing to storing has accumulated considerable quantities of reduced phosphate, will be imperfectly appreciated if the factor is omitted in estimating its actual worth, yet we feel constrained to insist that regarding practical usefulness it in no way approaches that pertaining to phosphate retaining the soluble form. Accordingly we are disposed to believe the demands of the farmer may be most effectually satisfied if farmers are advised to allot to phosphate an intermediate position between that occupied by soluble phosphate and insoluble, *i.e.*, undissolved phosphate, as it is in the form of bone. Undoubtedly there are a certain number of persons to be met with who would strongly advocate the claims of insoluble phosphate to be placed considerably higher in the scale of revalue than we have indicated, very probably supporting their remarks by stating that soluble phosphate itself shortly after application to the land becomes incapable of dissolving in water, although still available to plants, and unquestionably this statement is very true. Before, however, the alteration referred to takes place, the soluble phosphate has become diffused generally through the soil, and has brought within easy reach of the roots, in a way so thorough

as to be altogether unattainable for any insoluble body. Consequently, apart surely from every other consideration, this complete distribution and ultimate precipitation in a chemically divided condition must alone confer upon soluble phosphate infinitely greater advantages.—*Mark Lane Express.*

## Trade Notes.

**INCREASED SALT SHIPMENTS BY THE SHIP CANAL.**—A return of the exports of salt from the Mersey shows that, while there has been a more or less steady diminution in the Liverpool shipments as compared with last year, the salt trade of the Ship Canal continues to increase. During April the total shipments from the Mersey were 49,217 tons, compared with 48,879 tons in April, 1895. Of these 36,852 tons were shipped from Liverpool (compared with 37,094) and 12,365 tons from Runcorn and Weston Point (compared with 11,785 tons). The total shipments for the first quarter of this year amounted to 103,128 tons, compared with 114,419 tons in the corresponding period of 1895. Of this total 83,600 tons were shipped from Liverpool (compared with 102,724 tons last year) and 19,528 from Runcorn and Weston (compared with 11,695 tons). It will thus be seen that, whereas the salt exports from Liverpool during the first quarter of 1896 showed a falling off of 19 per cent., the exports from the Ship Canal increased during the same period by 67 per cent.

**CENTRAL AMERICAN INTERNATIONAL EXHIBITION.**—The London Chamber of Commerce has been requested by the Under Secretary of State for Foreign Affairs (Mr. Curzon) to render such assistance as it possibly can in giving publicity to the Central American International Exhibition, which is to be held in the capital of Guatemala, from March 15th to July 15th, 1897. Although it was decreed by the National Assembly that this should be a Central American Exhibition, still the Government are earnestly desirous for foreign nations to participate, and exhibits from any country will be admissible so far as they fall under: Science and letters, education, fine arts, mechanics and construction, agriculture, horticulture, arboriculture, special cultivation, fauna and floral, ornamentation, various industries, natural products, transport, mining, and immigration. In a special despatch to the Foreign Office, British Consul Roberts reports that at the present time the quality of British goods finding their way to Central America compares favourably with other countries, except the United States. Still it appears to him that the exhibition might be made a means of yet further introducing British productions, if British merchants would support it. At the present time there is a great demand for machinery (for railway construction, coffee cultivation, sugar cultivation, &c.) and hardware of every description, improved appliances for dairy purposes, electric light and motive power plant, bicycles, &c.; all clothing materials, musical instruments, cutlery, jewellery, food stuffs, fancy goods, and articles of *luxe* generally. To encourage exhibitors, their invoices of goods for display will be free of Consular fees, and the exhibits will be allowed to enter free of duty—only becoming liable to duty when sold in the country, except in the case of articles gaining a prize, which will be altogether exempt from duty even on sale. It would be necessary, in the Consul's opinion, for exhibitors to have some gentleman of good standing, well acquainted with commerce and the requirements of the country, to represent the English Section, receive orders, and to act as intermediary between the exhibitors and the purchasing public, so as to build up a permanent increase in the use of English goods. Applications for space must be addressed to the Central Committee at Guatemala before the 31st August next, and detailed information in this connection, as well as the text of the general regulations and of the Consul's despatch, may be seen on application at the London Chamber of Commerce, Eastcheap, E.C., between the hours of 10 a.m. and 5 p.m.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are firmer, the price for 90's now being 2s. 4½d. prompt, and 2s. 3d. to 2s. 4d. July-December; 50/90's 2s. to 2s. 1d. prompt. Carbolic acids are quiet, 60% crude being quoted 2s. 1d., and 40% crystals 7d. Crude naphtha is fairly steady at 8d., and solvent easier at 1s. 2d. Creosote is firm. Pitch rather firmer, prices now ranging 32s. to 32s. 6d., f.o.b. East Coast.

Sulphate of ammonia is in much better demand, both for prompt and autumn delivery. Buyers are more eager about prompt business, but are slow to pay the advance asked for forward. Prices are: London outside makes £8. 2s. 6d., Hull £8. 1s. 3d., Liverpool £8. 1s. 3d., and Leith £8. Forward Beckton £8. 5s. to £8. 10s. Hull £8. 2s. 6d., July.

## MISCELLANEOUS CHEMICAL MARKET.

The trade in alkalis generally is not marked by any special degree of activity, but there is a fairly good all round demand for the various products, and prices also are steady. Caustic soda remains in the same position as for some time past, spot quotations being as follows—f.o.b. Liverpool, 77%, £9. 7s. 6d. per ton; 74%, £8. 7s. 6d. per ton; 70%, £7. 7s. 6d. per ton; 60%, £6. 7s. 6d. per ton, 10 ton lots and upwards. Ammonia alkali unchanged at £3. 7s. 6d. per ton, bags, f.o.r. makers' works. Soda crystals 35s. per ton, bags, f.o.r. Bicarbonate, bags £6, f.o.r., and kegs £6. 15s., f.o.b. Bleaching powder remains steady at £6. 10s. per ton, f.o.b. Tyne, and £6. 15s. to £7. 5s., f.o.b. Liverpool; softwoods, f.o.r. makers' works, £6. 15s. to £6. 17s. 6d. per ton. Chlorate of potash slightly easier at 4½d. per lb.; soda 6d. per lb. Sulphate of copper: £18. 15s. to £19. per ton is still current quotation. Recovered sulphur £3. 12s. 6d. per ton, f.o.r. Acetate of lime (brown) quiet, and is without further change in value; grey in better demand. White sugar of lead and other acetates have rather an easier tendency. Potash, caustic and carbonate, are still in good request, and prices are firmly maintained. White powdered arsenic continues scarce, and with the limited output prices are held firm, both for prompt and forward delivery. Nitrate of soda steady at £8. per ton. Borax and boracic acid selling freely, and prices of the syndicate are firmly maintained. Yellow prussiate of potash quiet at 7d. to 7½d., according to make. Bichromates unchanged. Chromic acid 7d. to 7½d. per lb., according to quantity. Sulphocyanides without alteration in value. General y in the textile districts demand for chemicals is quiet, owing to the approaching Whitsuntide holidays.

## LIVERPOOL MINERAL MARKET.

During the last week our market has ruled very brisk. Manganese: Arrivals are *nil*; stocks are exhausted, and prices are strong; forward deliveries are slow, and higher prices are sought. Ground manganese is unaltered, the demand continuing good at £6., £8., £10., and £12. 10s per ton, according to quality. Manganiferous iron ore is in brisk demand. Chrome ore: There have been more arrivals, and prices are steady. Bauxite: The demand continues good, and prices are unaltered at 20s. for firsts, 16s. for seconds, and 12s. for third quality, f.o.b. French chalk: Arrivals have somewhat improved, but they can scarcely keep pace with the demand, especially for the higher grades; prices for "Angel White" brands are steady at 65s. to 70s., 80s. to 90s., and 100s. to 110s. per ton, according to grade, with an upward tendency. Wolfgram and scheelite: Stocks are *nil*; prices have considerably advanced, and there is a strong inquiry for forward delivery. Ferro-chromium and ferro-tungsten are unaltered. Arsenic is in good demand at full prices, £23. per ton being done for small lots. Fuller's earth is steady at late price, "Emerald" and other brands being done at 50s. for lump, 55s. for ground, and 75s. per ton for impalpable powder. Ochres and umbers remain unaltered, a fair business being done at 60s. for J.C. ochre, and 40s. for prime umber. Pumice stone is in more request, prime Teneriffe being done at £7. 10s., Italian lump at £10. 10s., and ground at £6. 10s. per ton. Keiselguhr meets with a steady sale at last prices. Asbestos and mica are firm at unaltered prices. Bog ore is steady with alteration in price, business being done at 22s. 6d. to 25s. per ton. Magnesite sells slowly, prices being somewhat easier. Plumbago is in fair demand at £6. to £10. per ton for prime founders' and lubricating qualities, prime Ceylon being done at £15. to £20. per ton. Carbonate and sulphate of barytes are quiet. Fluorspar is in quiet demand. Feldspar continues quiet. The inquiry for molybdenite, cerite, euxenite, ytterite, orthite, etc., is quiet.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

OILS.—Palm oil is inactive, and there is very little business to report. Prices, though unchanged, are nominal. Olive is in good request, and in consequence holders are very firm at their recent values. Linseed is quiet and featureless, quotations for Liverpool makes in export casks being 19s. 6d. to 20s. 6d. per cwt. Cottonseed is steady, and shows no signs of changing; prices are 16s. 6d. to 17s. 3d. per cwt. for Liverpool refined in export barrels, and 17s. per cwt. for American. Castor oil is rather feeble; sellers, however, are asking 2½d. to 2⅞d. for good seconds Calcutta, and 2¼d. to 2⅝d. per lb. for first pressure French. There is nothing to report in tallow. Resin is firm, but the inquiry is flagging somewhat, both for common and higher grades. Spirits of turpentine are steady, sellers being firm at 22s. 3d. to 22s. 6d. per cwt. Petroleum quiet, and sales indifferent: American stands at 6¼d. to 7½d., and Russian refined 5¾d. per gallon.

## THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, firmer: Scotch warrants closed at 46s. 10d.; Middlesbrough, 37s. 8d. cash, and hematite, 47s. 8d. Copper, steady: Chili bars, G. O. B.'s and G. M. B.'s, closed at £46. 11s. 3d. to £46. 16s. 3d. cash, and £46. 17s. 6d. to £47. 2s. 6d. three months. Tin, quiet: Straits closed at £60. 7s. 6d. to £60. 17s. 6d. cash, and £61. to £61. 10s. three months; Australian, £61. 7s. 6d. English ingots, £64. Lead, steady: Spanish, £11. 1s. 3d. to £11. 2s. 6d.; English, £11. 3s. 9d. to £11. 5s.; Silesian spelter, ordinary, £17. 10s. to £17. 12s. 6d. Nickel, 1s. 2½d. Antimony, £30. to £30. 10s. Quicksilver: First hands, £6. 15s.; second hands, £6. 14s. Copper shares, steady: Cape, 2⅞ to 2⅞; Copiapo, 2⅞ to 2⅞; Libiola, 2⅞ to 3; Mason and Barry, 3 to 3¼; Rio Tinto, 21⅞ to 21⅞; Tharsis, 5¼ to 5½.

GLASGOW, WEDNESDAY.—Market again strong, with good business. Scotch done at 46s. 6½d. and 46s. 10d. cash, also at 46s. 8½d. and 47s. one month; closing with buyers at 46s. 6d. cash, sellers ask 46s. 10½d. Cleveland done at 37s. 5d. and 37s. 8d. cash; closing with buyers at 37s. 8d. cash, sellers ask 37s. 9d. Cumberland hematite done at 47s. 8d. and 47s. 7½d. cash, also at 47s. 11½d. and 47s. 10½d. one month; closing with buyers at 47s. 8d. cash, sellers ask 47s. 8½d. Middlesbrough hematite done at 45s. 6d. one month; closing with buyers at 45s. 3½d. cash. Market closed till Tuesday.

## REPORT ON MANURE MATERIAL.

The market has been quiet throughout the week, but without much change in values. Mineral phosphates offer freely, easy freights being obtainable, and buyers having for a long time held back. Large sales of 75/80% Florida rock have been made for the Continent at free on board prices, and business has also been done on c.i.f. terms. The quotations are 6¼d. to the Baltic and 6d. to North Sea ports, and 5¼d. per unit would probably be business to good United Kingdom ports. There are sellers of South Carolina at 5¼d. per unit to United Kingdom. The quotations for Algerian are 5¼d. for 58/63%, and 5½d. for 63/70%. No sales of River Plate bones are reported, but £3. 12s. 6d. would probably do for cargoes afloat. £3. 17s. 6d. asked for fine crushed Kurrachee bones on quay at Liverpool. Bombay bone meal may be had at £3. 12s. 6d. to £3. 15s. per ton, according to quality, and for shipment £3. 10s. is nearest value. Nitrate of soda is quiet, demand, owing to continued dry weather, having fallen off: On spot ordinary quality may be had at 7s. 10½d. per cwt., and fine quality at 8s. Arrived cargoes, ordinary quality, have been done at 7s. 10d. per cwt. Autumn shipments are worth 8s. 3d. to 8s. 4½d. per cwt., according to position.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

The feeling in the market for general chemicals is perhaps a shade healthier, as compared with the past few weeks, but at the best it is unsatisfactory from the producers point of view. There are no changes of price in any of the standard chemicals, and hardly any amongst the other sorts. Sulphate of copper, however, continues to harden, and is now fetching £19. The export section of the chemical trade remains unsatisfactory, and the inland department, though slack enough, compares favourably with it. Sulphate of ammonia has further given way, and since last week £7. 17s. 6d. has been accepted, although not all the makers are willing to take this, some of them standing out for £7. 18s. 9d. In mineral oils and solid paraffins there is no change, things being rather quiet. Lubricants are the best of this lot, steadily holding to the prices as recently improved.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £4. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62° £6. 7s. 6d., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £7. nett, Tyne; saltcake, 23s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 5d. less 5%, Liverpool; nitrate of soda, 8s. to 8s. 3d.; sulphate of ammonia, £7. 17s. 6d. to £7. 18s. 9d., f.o.b. Leith; salammiac, first and second white, £39. and £37. nett, any port; sulphate of copper, £19. less 5%, Liverpool; paraffin scale, hard, 1½d. to 1¾d., and soft, 1¾d. to 2d. per lb.; paraffin wax, 120° semi-refined, 2⅞d. to 2¼d. per lb.; paraffin spirit (naphtha), 7d. per gallon; paraffin oil (burning) No. 1, 6d., and crystal, 6¼d., at works, for Scotch buyers (English sales about ½d. lower); ditto (lubri-

5° 45', 885° 45. 10s. to 46., and 890/895° 46. to 46. 10s. Imports of sugar at Greenock were 51,212 bags jaggery unrefined, 16,065 bags beet unrefined.

## L PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

Manufacturers are somewhat disappointed with the position here, which held out full promise of being an exceptionally good one during the opening months of the year. The imports into date include the following:—Linseed, 265,278 quarters, 05,931 quarters; rapeseed, 33,676 quarters, against 55,879 cottonseed, 80,104 tons, against 84,300 tons; olive oil, 4,736 casks; rape oil, 1,779 casks, against 4,736 casks; oilcakes, 7,493 tons, against 6,515 tons; tallow, 18,960 tons, against 5,171 cwt.; turpentine, 6,221 barrels, against 4,300 barrels.

Linseed oil has declined about 5s. per ton, closing steady at 14s. 7½d., naked; June-August and September-December offer 1½d.; boiled and refined, from 11s. to 12s. per ton extra. The week has been 3,860 cwt. Refined cotton oil steady at 14s. 7½d., naked; May-August deliveries, however, easier, and 14s. 9d., naked, accepted; November-April 15s. 3d. Casks 11s. and ordinary barrels 30s. per ton extra. Turpentine of refined oil has been 7,940 cwt. for the week. Turpentine, live oil unchanged. Castor oil, 2½d. per lb. for first Cod oil from 17s. to 20s. per ton. Boiled siccative oil, 10s. American cottonseed oil soap, 70% fatty acids, is 11s. in barrels. Locomotive grease, 10s. 10s. per ton.

Linseed cakes quiet: 95% pure, 45s. 12s. 6d. to 46s. 12s. 6d.; Russians, 45s. 12s. 6d.; Oilcakes, 44s. 17s. 6d.; Cotton cakes steady: best makes, 43s. 17s. 6d.; 43s. 12s. 6d. Rape cakes unaltered.

Makers continue very busy. Prices are:—White lead, dry; red lead, 14s. 10s. to 15s. dry. Various assorted oil range from 11s. per ton. Ready mixed paints, in tins, Dry mineral colours range from 43s. 10s. to 48s. according to quality.

Paint remover, 11s. 5s. to 11s. 10s. per cwt. Imperial nish, 45s. 10s. per ton. Oak varnish, from 5s. 6d. per

## TYNE CHEMICAL REPORT.

TUESDAY.

Market is without alteration. Shipments continue at about average, but new business is only limited. Sulphur is scarce at 43s. per ton. Soda crystals, 42s. 2s. 6d. per ton, gross weight, Caustic, 76/77%, 49s. 5s. per ton; 70%, 47s. 10s. to 47s. 15s.

ing powder, softs, 47s. per ton, nett; hard, 47s. 5s. per ton, stic soda, 76/77%, 49s. 5s. per ton, nett; do., 70%, 47s. 15s. nett; recovered sulphur, 2 cwt. bags, 43s. 17s. 6d. per ton, nett; 48%, 44s. per ton, nett; do., 50%, 44s. 3s. 4d. per do., 52%, 44s. 6s. 8d. per ton, nett; alkali, 36%, 42s. 15s. nett; white alkali, 48%, 44s. 10s. per ton, nett; do., 50%, per ton, nett; do., 52%, 45s. per ton, nett; hyposulphite of cwt. casks, 46s. 5s. per ton, nett; do., 1 cwt. kegs, 47s. nett; silicate of soda, 75° Tw., 42s. 12s. 6d. per ton, nett; Tw., 43s. per ton, nett; do., 140° Tw., 43s. 7s. 6d. nett; soda crystals, casks, 42s. 2s. 6d. per ton, nett; do., 2 cwt. bags, 42s. 2s. 6d. per ton, nett weight; of potash, 5d. per lb., less 6%; pearl hardening, ton, nett; pure white sulphate of alumina, 43s. 17s. 6d. nett; blanc fixe, 47s. 5s. per ton, nett; chloride of barium, ystals, 46s. 15s., per ton, nett; do., 90/95%, crude calcined, ton, nett; sulphide of barium, crystals, 44s. 15s. per ton, nett; of alumina, 43s. per ton, nett; aluminate of soda, 43s. nett.

South Durham salt steady at 9s. per ton, f.o.b. Tees, demand.

The trade is quiet though steady, and most of the collieries are fairly well employed. Coke is still in good

demand both for inland and export consumption. Best Northumbrian steam, 8s. 3d. to 8s. 6d. per ton; second qualities, 7s. 3d. to 7s. 6d. per ton; small steam 3s. 9d. to 4s. per ton; bunker coals, 6s. 3d. to 6s. 6d.; gas coals, 6s. 6d. to 6s. 9d. per ton; household coals, 10s. per ton; coke firm, 15s. to 15s. 6d. per ton.

## New Companies.

**Nobe's Disinfectants, Ltd.**—CAPITAL £5,000., in shares of £1. each. This company has been formed to manufacture, sell, and deal in disinfectants and chemical compounds.

**Patent Oxide Syndicate, Ltd.**—CAPITAL £4,000., in £1. shares. This company has been formed to manufacture and sell apparatus for carburetted hydrogen gas, and producing metallic sulphates.

**Well-street Oil Works, Ltd.**—CAPITAL £5,000., in £1. shares. This company has been formed to enter into an agreement with W. M. Woollett to take over the oil works at Well-street, and manufacture, sell and deal in soap, oils, paints, and varnishes.

**Anglo-Peninsula Mining and Chemical Co., Ltd.**—CAPITAL £100,000., in shares of £1. each. This company has been formed to acquire lands and mines in Portugal, and to prospect for arsenic and other minerals. The subscribers to the memorandum of association are:—E. H. Williamson, Berkhamstead, Herts, merchant; R. P. Cooper, Berkhamstead, Herts, manufacturer; G. Threlfall, 50, Fenchurch-street, E.C., engineer; S. R. Timson, Berkhamstead, manager; R. A. Cooper, Berkhamstead, manufacturer; C. Pengilly, Scorrer, Cornwall, engineer; G. Neill, 50, Fenchurch-street, E.C., engineer.

**British Oil and Guano Co., Ltd.**—CAPITAL £10,000., in £1. shares. This company has been formed to manufacture, sell, and deal in products from fish, fish offal, and other animal offal. The subscribers to the memorandum of association are:—J. C. Chisholm, Fairfield House, Dalkeith, solicitor and banker; S. Trotter, 21, Dublin-street, Edinburgh, advocate; W. F. King, Russell Place, Trinity, Edinburgh, electrical engineer; W. Cran, Kirkton, Bunchrew, Inverness, manure manufacturer; J. Wilson, Cragdale, Merchison Avenue, Edinburgh, builder; G. Anderson, 10, St. Andrew's Square, Edinburgh, solicitor; W. F. Trotter, M.A., 21, Dublin-street, Edinburgh.

**Lead Oxide Co., Ltd.**—CAPITAL £20,000., in £1. shares. This company has been formed to carry on the business of lead smelters, desilverisers, drysalts, oil and colour manufacturers, and dealers in cements, paints, varnishes, &c. The subscribers to the memorandum of association are:—T. C. Sanderson, 53, Cardiff-road, Norwich, engineer; G. V. Barton, Waltham Buildings, Holborn Circus, merchant; G. P. Wright, 14, Venner-road, Sydenham, clerk; S. C. Pratt, Stanmore, Beulah-Hill, Norwood, retired; C. W. Matthews, 25, Budge-row, E.C., clerk; F. R. W. Sampson, Oakleigh, Godstone, major; B. Saul, 136, Cromwell-road, S.W., merchant.

**American and Foreign Maypole Soap Co., Ltd.**—CAPITAL £25,000., in £1. shares. This company has been formed to acquire certain foreign patents and to carry on the business of soap manufacturers and merchants, and dealers in chemical and other articles for the toilet. The subscribers to the memorandum of Association are:—A. S. Bishop, 1, Florence street, Islington, agent; A. J. Tozer, 10, Queen Victoria-street, E.C., agent; F. G. Marshall, 51, Queen Victoria-street, E.C., merchant; E. J. Chappell, 62, Sotheby-road, Highbury Park, gentleman; A. E. Newton, 6, Bream's Buildings, Chancery-lane, gentleman; H. E. Hughes, 85, Lordship Park, N., merchant; H. P. Griffin, 34, Albany-street, N.W., clerk.

**B. Cannon and Co., Ltd.**—CAPITAL £35,000., in £5. shares. This company has been formed to acquire the business of W. and B. Cannon, at Lincoln, and to trade as leather dressers and manufacturers of glue, gelatine, &c. The subscribers to the memorandum of association are:—Mrs. M. A. Cannon, 71, Monks-road, Lincoln; W. J. Cannon, St. Margaret's Lodge, Lincoln, leather dresser; F. J. Delany, 7, Avondale-street, Lincoln, accountant; T. Scott, 2, Market Place, Hull, merchant; H. Wright, Wellington-road, Bridlington Quay, merchant; J. Ostler, 12, Crown Terrace, Scarborough, merchant; C. Kuypers, Leadenhall House, E.C., merchant.

## Notices.

Communications for the *Chemical Trade Journal* should be sent to, and Cheques and Post Office Orders made payable to—**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*,—payable in advance,—including postage part of the world, are as follows:—

|                                |          |
|--------------------------------|----------|
| Early (52 numbers) .....       | 12s. 6d. |
| Half-Yearly (26 numbers) ..... | 6s. 6d.  |
| Quarterly (13 numbers) .....   | 3s. 6d.  |

Subscribers will oblige by making their remittances for subscriptions by Post Office Order, crossed and payable to "Davis Bros."

Contributors are invited to forward items of intelligence, or cuttings from newspapers, of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to chemical and allied industries, home and foreign, are solicited. Contributors should condense their matter as much as possible, on one side only of the paper, and in all cases give the names and addresses, not necessarily for publication. Sketches should be on separate sheets.

## Advertisements.

Advertisements of Situations Vacant, Premises on Sale or To be Let, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

|                                |                       |
|--------------------------------|-----------------------|
| 30 Words and under .....       | 2s. 6d. per insertion |
| Each additional 10 words ..... | 6s. 6d.               |

Advertisements of Situations Wanted are inserted at one-half the rates when prepaid, viz.:—

|                                |                       |
|--------------------------------|-----------------------|
| 30 Words and under .....       | 1s. 6d. per insertion |
| Each additional 10 words ..... | 3s. 3d.               |

Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff rates, which will be forwarded on request.

Advertisements intended for insertion in the current week's issue should reach the office by Thursday morning at the latest.

## CURRENT TOPICS.

### THE SULPHUR INDUSTRY.

THE sulphur industry is one closely connected with the alkali trade, although the use of brimstone has largely been superseded by the introduction of pyrites as a source of sulphur. In the chemical trade as a whole, however, there is still a good deal of vitriol made from brimstone only, since the acid made in this way is considered better than pyrites acid, particularly by mineral water makers, who are always afraid of the arsenic that is well known to be present in pyrites. Even in this direction there have been innovations, spent oxide and recovered sulphur having constituted fresh sources of supply, thereby affecting the quantity that is imported from Sicily.

At the time when these new sources of supply were gaining ground it was generally thought that the Sicilians would be able to make such reductions in price as would keep their competitors in check, and certainly there has been a steady fall in values ever since. This line of action has, however, not been without its adverse effects, and to judge by the state of the industry during the last year, there was good reason to suspect that the end of the tether had been reached.

Efforts have been made to improve matters by combinations to restrict the output, but they have all been to no purpose, and at last the Italian Government has had to give way, and reduce the export duty.

The last straw that seemingly was almost too much for the suffering producers was the discovery of a promising sulphur mine in the United States. Seeing that this is one of the best markets for Sicilian sulphur (pyrites being quite in their infancy, so to speak), this latest development might well have caused consternation among the Sicilian producers.

They have at all events cause to congratulate themselves on one point, and that is the open-handed way their Government have dealt with the matter. Tinkering with the export duty would evidently have afforded no practical relief, and this the Government certainly cannot be said to have done. While they were at it they made such a sweeping reduction that it virtually amounted to abolishing the tax altogether. The old tax was 106d. per ton, which amounted to about 20 per cent. of the selling price in Sicily. Under the new arrangement the trifling duty of 10d. per ton only will have to be paid.

This is all very well for the producers, and, as far as can be seen at present, will, if anything, work to the advantage of the consumer also, as it is very probable that this reduction of duty will lead to an increase in the output, which, in the present state of the market—to put it mildly—will not tend to raise the price.

Whether the Sicilian trade will benefit materially by doing a larger business unless they can keep prices stationary is another matter altogether. As things are at the present moment there is a difference of 5s. per ton between recovered

sulphur and Sicilian, so that they have the start in their favour. It remains to be seen how they will stand at the finish.

#### THE PROSPECTS OF THE AUTO-CAR.

The proceedings of the House of Lords last week have shown pretty conclusively that as far as legislative difficulties are concerned the future of the auto-car is assured. Compared with the delay and discussion that generally attends the alteration of any law bearing on locomotion, the rapidity with which the necessary changes for the introduction of this new type of horseless vehicle have been effected, is phenomenal.

Although no doubt steam, electricity, and gas will all play a part in the development of these new motor carriages their future is of peculiar interest to many, on account of the opening that will be made for the wide extension of oil as a motive power. For these comparatively light purposes there is a great advantage about oil, owing to an oil motor being more self-contained than its rivals. For stationary work there is not much to choose between oil and gas, while as a matter of preference we should be more prone to the latter. It is handy and wants no storing. Where it is a case of a portable motor, however, the comparison is quite different, for here the question of storage is of paramount importance, and even compressed gas comes a long way behind oil, which in the case of an unforeseen accident can be obtained at short notice almost anywhere. In fact it is most certain to be obtainable at those out-of-the-way places where gas and other commodities are unattainable.

There is no need to refer to the drawbacks of steam. Steam carriages are quite feasible, but for ordinary purposes and ordinary persons the oil motor is much more simple and manageable. Electricity is perhaps in a way the simplest of all, but here again the troubles of charging and the necessary charging stations come in. If your power gives out in a quiet country place, with darkness coming on, the impossibility of bringing the charging station to the car, while the car refuses to bring itself within reasonable distance of the station, will be found to be two drawbacks that will militate seriously against the popularity of this particular form of motor. With oil the stock in the reservoir can be seen and appreciated, even by the attendant "tiger," and should his powers of estimation prove deficient, he can have the fact impressed on his mind, by having to beg, borrow, or purchase a fresh supply of oil from the place nearest at hand, and carry the same to the car. There is no need to push the car until the location of the oil is reached.

Opposition is sure to be raised by sentimentalists about the extermination of the good and faithful horse, but it must be remembered that there is no reason to suppose that anything but the drudgery of horse life will be done by auto-cars for a long time to come, so that they ought to be welcomed by those who at present are opposing them. Apart from the noiselessness of traffic, the cleanliness of streets, and the end of the terrors of the asphalt pavement, there is, we think, a most promising future for all connected with oil, in catering for the developments that are sure to attend the spread of oil as a motive power, as soon as the use of auto-cars has been officially legalised. We can only hope that those who are disposed to be indifferent will look to it, and not let such a promising opportunity pass without an effort to benefit by it.

PERSONAL.—Among those who have received birthday honours, we notice the name of Joseph Verdin, Esq., who is so well known in connection with the Cheshire salt trade, and on whom her Majesty has been pleased to confer a baronetcy.

## Legal Intelligence.

### HIGH COURT OF JUSTICE. CHANCERY DIVISION.

(Before Mr. Justice Kekewich.)

THE LANCASHIRE EXPLOSIVES COMPANY (LIMITED) v. THE ROBURITE EXPLOSIVES COMPANY (LIMITED).

THIS was a motion on behalf of the plaintiff company to commit the respondents, Mr. Harris Rigg Wither, the general manager of the defendant company, and Lieutenant-General Sir John Stokes, its chairman, for alleged contempt of court in disobeying an injunction granted by the Court of Appeal on November 12, 1895, restraining the defendants from infringing the plaintiffs' patent of 1885, and for damages. The patent of 1885 (Lamm's patent) was for the manufacture of an improved kind of safety explosive. The invention consisted of taking "two solid substances, a nitrate, as, for instance, nitrate of ammonia, nitrate of potash, nitrate of baryta, or nitrate of soda, and a bi- or tri-nitrate of carburetted hydrogen, such as dinitro-benzene, trinitro-naphthalene, or trinitro-toluol, mixed in such proportions that in the explosion the hydrogen of the carboniferous matter burns to water and its carbon burns to carbonic oxide, or carbonic acid, or a mixture of both. Then the patent went on to describe the manufacture of the above materials into an explosive. This action was commenced in 1894 by the plaintiff company for the purpose of restraining the defendant company from an alleged infringement of the patent, with the result, as above stated, that the Court of Appeal granted the injunction asked. The plaintiff company now alleged that since the order of the Court of Appeal the defendant company had been manufacturing a particular safety explosive called "Roburite No. 3," which, the plaintiffs said, constituted a breach of the injunction, and accordingly the plaintiff company served the defendants' chairman and general manager with a notice of motion as above stated.

Mr. Moulton, Q.C., Mr. Terrell, Q.C., and Mr. Rubie, for the plaintiff company, stated that what was aimed at by the plaintiffs' patent, was the invention of an explosive substance free from the dangers attending explosives—such as nitro-glycerine—which were liable to be exploded either by a blow or shock. What the defendants had now done was, as they admitted, to take the plaintiffs' substances, dinitro-benzene and nitrate of ammonia, being the compounds required to bring about an explosion; but they said they had adopted other and independent methods of manufacture, one of which was the "chlorination" of one of the compounds—dinitro-benzene—by introducing into it a percentage of chlorine. These methods of manufacture were merely a colourable imitation of the plaintiffs' manufacture, and were an infringement of their patent.

Mr. Cripps, Q.C., Mr. R. Wallace, Q.C., and Mr. A. B. Shaw, for the respondents, contended that there had been no infringement of the plaintiffs' patent or breach of the injunction, and read affidavits tending to show that Roburite No. 3—the explosive made by the defendants—was entirely distinct from the plaintiffs' article.

Mr. Justice Kekewich, after a careful review of the processes of the plaintiffs' and defendants' manufactures respectively as shown by the evidence, came to the conclusion that the defendants' explosive was not a colourable imitation of the plaintiffs', and refused the motion, with costs.

### THE PETROLEUM INQUIRY.

IN giving evidence before this committee, last week, Lord Kelvin stated that he had been conversant with the use of paraffin for many years, that illuminant having been in constant use at submarine cable stations since 1858. In 1873 he was engaged in laying cables on the cable ship *Hooper*, off the coast of Brazil, when two accidents occurred on board. The first was caused by the upsetting of a paraffin lamp in the electrical testing-room, the result being that some of the woodwork of the cabin testing-room was burned. The lamp was upset, doubtless by the rolling of the ship, in the absence during the dinner hour of the officer in charge. The second accident, which was probably due to carelessness, was more serious, the blazing paraffin running down into the engine-room and falling on one of the engineers, whose life for some time was despaired of. In consequence of these accidents he had an examination made of all the paraffin on board, and found that, by the open flashpoint, three of the samples flashed at 107°F., while the fourth, which was a special mineral oil, did not flash till 270° was reached. The captain considered the paraffin, except the last, so dangerous in a hot part of the world, with a temperature of from 80° to 100° in the cabin and higher in the engine-room, that he had it thrown overboard. From his experience he was of opinion that 107° Fahr. was much too low for safety, and, unless there was some good reason to the contrary, the sale of paraffin for ordinary use of a lower

nt than 130° open test ought to be prohibited by law. That ended to 103° close test. That 25 per cent. of the deaths by London last year were due to paraffin lamp accidents was, to his regret, asked by the chairman if it was possible to have lamps of any kind in general use without accidents, he said it was possible to have an illuminant which if applied to a combustible should not set it on fire. Mr. Jesse Collings asked the witness the number of accidents did not represent but a small percentage considering the millions of lamps in use. Lord Kelvin replied accidents in general being preventable they ought not to be with any percentage, however small, if the causes were easy of

If possible a standard of 120° Abel close test should be because one could never be sure that the oil in the lamp might be at a temperature of 120°. In reply to Mr. Compton Rickett, Kelvin said he did not think it would be wise to introduce restrictions upon the manufacture and sale of lamps. It was hopeless to introduce safety by legislation at present. The dangerous lamps were not in poor houses but in fine drawing-rooms. Some of those on tall stands with large crystal reservoirs would be very bad accident if they fell over. He attached considerable importance to being able to see the quantity of oil in a lamp by means of a reservoir, but this was more than counterbalanced by the danger of the lamp being knocked over and the glass broken. No doubt a lamp with a reservoir raised the heat more, though not much more, and his suggestion would be an aluminium reservoir with a Röntgen ray to see inside

### THE CHEMISTS' EXHIBITION.

The second of the exhibitions in London organised in connection with the *British and Colonial Druggist* will be held from the 28th August next, at the National Skating Palace, Argyll-terrace, V. For the exhibition of 1895 a larger attendance of the exhibitors of the trade was secured than had ever before assembled on any occasion. In four days it was visited by considerably over a million chemists, by large numbers of London and provincial wholesale manufacturers connected with pharmacy, by hundreds of men, and nearly a thousand nurses, besides thousands of the public. The arrangements which obtained that result will this year be improved and amplified, and an even larger attendance of exhibitors can confidently be expected. The very unusual course of opening a considerable sum out of the revenue of the exhibition to be used in reduction of the railway fares of provincial subscribers to the exhibitors in the *British and Colonial Druggist* so that they have an opportunity to visit the metropolis at fares materially less than the cheapest excursion rates arranged by the railway companies, has again been adopted on an extended scale.

The National Skating Palace, in which the exhibition is to be held, is a spacious hall, very massively built in the form of a modern theatre. The ground floor affords a space of 135 feet by 95 feet available for exhibitors, while above this are two tiers, also giving material for exhibition purposes. The visitors enter from the street to the ground floor, from which a few steps take them either to the ground floor or the upper tier. There are adequate entrances for goods level with the ground floor, space for empties, etc., in a capacious basement, for accommodation. The electric light is profuse, and supplied to the building, which also offers all necessary accommodation for exhibitors and visitors. The entire place will be well appointed, furnished, and decorated in a manner not usual in trade exhibitions. The extensive refrigerating apparatus beneath the building, for the manufacture of ice for skating, will be available, and the temperature in the building can be kept down to any degree desired. It will be supplied every afternoon and evening by a special train.

On the day medical men and nurses will be specially invited, and full notice will be given to exhibitors in order that they may display the articles in which the members of these classes will be immediately interested. A special exhibition number of the *British and Colonial Druggist* will be widely distributed throughout the exhibition. After the exhibition has been held, and will contain a comprehensive description of the exhibition with numerous illustrations, to prevent any misunderstanding it should be noted that this does not form any part of a contract for space, and there is no guarantee to any exhibitor that his exhibit will be described or his stand illustrated. Messrs. A. Elmes and Co., 347, Upper-street, Islington, N., have been appointed official stand fitters, and they are acquainted with the conditions prescribed by the landlords to prevent injury to the building. Exhibitors are at liberty to employ their own fitters, but should impress on them the necessity to avoid giving rise to damage to the building, etc. Arrangements have been made with Messrs. Nicholson and Tyler, of 5, Crown Court, Cheapside, to supply electricity for power, and for the lighting of exhibitors'

own stands where desired. Arrangements with firms to do any work for, or to supply anything to exhibitors, have been made solely for the convenience of exhibitors, the only stipulation with them being that, in the interest of the exhibitors, a moderate uniform rate shall be charged. Refreshments to visitors will be supplied by the National Skating Palace Co. Having regard to the advantages offered in the situation, nature, and appointments of the building, and in the extensive attendance secured (the exceptional methods adopted entailing specially heavy expenses), the tariff for space will be found very moderate. The prices for positions are from 2s. 6d. per square foot, payable half on allotment, and the balance on or before August 17. Exhibitors will be entitled to invitation tickets, available on any day, for the purpose of specially inviting their customers to visit the exhibition. Such tickets will be charged for at the rate of 6s. per dozen; 100, 30s.; per 100, afterwards, 25s. Exhibitors taking 100 tickets, or more, can have their names printed (free) as the donors, if instructions be given at the time of ordering, not later than one month before the opening of the exhibition. A descriptive catalogue will be published, in which advertisements will be inserted at £3. whole page, £1. 15s. half page, and £1. quarter page, payable on publication. Exhibition offices: 42, Bishopsgate Without, London, E.C., and it is requested that communications be addressed to the manager.

### PROSECUTIONS FOR MILK ADULTERATION.

SEVERAL cases involving points of considerable interest under the Food and Drugs Act were heard before Mr. Headlam at the Manchester Police Court last week. In the first case three persons were concerned. An inspector attached to the Sanitary Department of the Town Hall took a sample of the milk sold by Francis Henry Winkup, a small shopkeeper in Gardner-street, West Gorton, and on analysis it was found that the milk had been deprived of fat to the extent of 27%. Winkup, however, declared he sold the milk exactly as he received it from a wholesale milk dealer named Alfred Houchin, of Hyde-road, Gorton. A sample of the latter's milk was taken, and was found to have also been deprived of fat to the extent of 26%. Houchin, in turn, declared that he had sold the milk as he received it from George Hazlehurst, of Blue Slate Farm, Twemlow. Accordingly on different occasions samples were taken of Hazlehurst's milk as it was delivered at Longsight Station. Subsequently two inspectors went to Hazlehurst's farm and asked for a sample of milk as it came from the cows, but Hazlehurst would not allow them to have the milk until after it had passed through the refrigerator. The samples of the milk that had been taken at Longsight Station had, according to the analysis of Mr. C. Estcourt, the city analyst, been deprived of fat to the extent of from 16 to 45%. The analysis of Mr. Charles Blades, a member of the Society of Public Analysts, who had also examined the same samples, produced very different results. Under these circumstances, it was agreed that the summonses against the defendants should be adjourned for a fortnight, to allow of Mr. Estcourt and Mr. Blades making a joint analysis of the samples. Mr. G. Rook prosecuted, Mr. Gilmour appeared for Houchin, and Mr. Fletcher for Hazlehurst. The second case was of a similar character, and the wholesale and retail dealers both declared that they had sold the milk, which had been deprived of fat to a considerable extent, as it had been delivered to them. Accordingly a sample was taken of the milk as it was supplied by Joseph Taylor, of Whitely Green Farm, Adlington, Cheshire, and it was found that fat had been abstracted to the extent of 32%. Mr. Brown, who represented Taylor, contended that the milk dealers had combined to throw all the blame upon the farmers, and he also complained that the inspectors attached to the Sanitary Department of the Town Hall took advantage of "the poor unsophisticated Cheshire farmers." Mr. Headlam fined Taylor £5. and costs. The summonses against the wholesale and retail dealers were withdrawn. Joseph Samuel Shaw, of Egerton-street, Moss Side, was fined £2. and costs for selling milk containing 5% of added water, and for a similar offence Mathew Wild, of Lowestreet, Miles Platting, was likewise found £2. and costs. For selling milk which contained 7½% of added water, Alfred Lord, of Rochdale-road, Harpurhey, was fined 10s. and costs.

THE BLACKLEY CHEMICAL WORKS FATALITY.—In the House of Commons last week, Mr. Schwann asked the Home Secretary whether his attention had been drawn to the case of Henry Bruckshaw, of Hill-lane, Blackley, Lancashire, a night watchman at Levinstein's Chemical Works, Blackley, who, whilst on duty on the 12th of May, fell into a tank of vitriol, and died the same day from the effects of his injuries; and whether he would cause inquiries to be made as to whether the tank was properly protected; if not, as to the responsibility of the owner, and the inspector whose duty it was to protect workmen on the premises. Sir M. White Ridley replied that the inspector had been directed to report on the fact.—(Vide Correspondence Column.—Ed., C.T.J.)

## WOOL OILS.

IN the course of a paper on these oils read before the Society of Dyers and Colourists, Dr. J. Lewkowitsch has contributed many points of interest. He first calls attention to the fact that the term wool oils or cloth oils is not a scientific term. In the trade there are comprised under the name wool oils or cloth oils all those oils that are used by woollen manufacturers for lubricating the wool before spinning or for oiling the rags before grinding and pulling.

We may sub-divide the wool oils into three classes, viz., (a) fatty oils, (b) emulsion oils, (c) solutions of soap.

The following is a list of the *fatty oils* or their products used in the woollen industry: they are arranged in the order of their suitability and quality, commencing with olive oil, which is used for the best kind of wool, and ending with oils consisting in great part of unsaponifiable matter.

Olive (Gallipoli) oil, lard oil, oleine (= oleic acid) [saponification or saponified oleine, distillation or distilled oleine], distilled grease oleine, black recovered oil, "seek oil," and brown [grease] oil.

It will be noticed that no mention is made of mineral oils, mineral oils as such being unsuitable for oiling wools. Of course it is well known that mineral oils are very largely used to adulterate fatty oils intended for the woollen industry; and the number of "manufactured" oils or "blends" is almost legion.

The second class, *emulsion oils*, are chiefly aqueous solution of soda or ammonia, containing larger or smaller quantities of oleic acid soap and mineral oils held in solution by the soap.

The third class of oils, *soap solutions* pure and simple, as represented by solutions of castor oil soap or of a neutral alkali salt of sulphuric-oleic acid, are, as it were, ideal wool oils.

The principles upon which the valuation of wool oils must be based are the following:—In the first instance, wool oils should be *easily removable in the scouring*; they should therefore be free from drying oils, or their fatty acids. For these oils are readily oxidised by the oxygen of the air, and their products of oxidation offer great resistance to the soap solution in the scouring process; and, further, as they become sticky they leave an unpleasant odour on the fabric, and cause stains in the finished cloth. For similar reasons resin products, either as resin oils or resin acids, must be absent. The question whether mineral oils (or at least small quantities thereof) are permissible in wool oils does not seem to have been decided yet in a satisfactory manner.

Mineral oils are mixed with fatty oils simply to cheapen the price. Small quantities of hydrocarbons in the oils for finer goods may not be objectionable as such, the mineral oils readily forming emulsions with the soap solution in the scouring process, and thus being easily removable. The low class oils contain large proportions of hydrocarbons, but even they can be removed with comparative ease, as in the manufacture of the goods for which these oils are employed strongly alkaline soaps are used. Morawski states that even as much as eighty parts of mineral oil yield a complete emulsion with ten parts of a ½% soda solution.

In the author's own opinion mineral oils should not be present in wool oils intended for better class goods.

The fact that the mixing of mineral oils with fatty oils is permitted, leads to fraudulent practices, and as the schedule of the Insurance Companies permit mineral oil, the seller of wool oils exercises his ingenuity in preparing blends readily saleable as long as they conform to the letter of the schedules. Perhaps one of the best arguments against the use of mineral oils, an *argumentum ad hominem*, is afforded by the fact that a shoddy manufacturer will use oils containing mineral oil when he sells the shoddy, whereas he is careful to use saponifiable oils only when he spins the shoddy himself.

In the second instance, wool oils should *develop as little heat as possible*, both in the stored raw material and during the working of the oiled material. Drying oils may easily give rise to a development of heat sufficient to cause spontaneous combustion.

Heat may be also produced in the scribbling and carding process, and the action of free fatty acids on the metal of the scribblers must be taken into account.

Therefore the *flash point* and in general the *liability of an oil to cause a fire*, or to favour the spreading of it, is of the greatest commercial importance. This point will have to be considered, especially as the Fire Insurance offices put great strictures on the users of wool oils, assessing as they do the insurance premium according to the quality of the oil.

It may, therefore, be found useful in this connection to quote the order in which the schedules of the Fire Insurance Companies in this country arrange the oils:—

Free from any extra charge are:—Olive (Gallipoli) oil, lard oil, oleine ("saponified" or "distilled") not containing more than 10 per cent. of unsaponifiable matter, fish oil, or a manufactured oil

("purified by distillation or saponification," whatever this may mean) containing not more than 30% of unsaponifiable matter, and having a flash point of not under 340°F. (167.8°C.).

A higher rate is charged for manufactured oils containing more than 30% but not more than 50% of unsaponifiable matter.

A still higher rate is charged for black (recovered) oil, containing not more than 50% of unsaponifiable matter.

The highest rate is charged for manufactured oils containing more than 50% of unsaponifiable matter, or mineral oil, oil of pine, linseed oil, rape oil, cottonseed oil, or any other seed oil.

The determination of the unsaponifiable matter and of the flash point are, therefore, of the greatest importance in the analysis of wool oils.

But little need be said here about the determination of unsaponifiable matter, as the methods for its determination are well known. It may, however, be useful to again point out that the unsaponifiable matter should not be determined by difference, as is being done by some analysts, who determine saponifiable matter only, returning the unsaponifiable as the difference. Such unsaponifiable matter is then generally called mineral oil, although it may be a solid alcohol, as is the case when wool grease or its distillates are present in the wool oil under examination.

The determination of the flash point hardly calls for any remarks, as this test is well known. Of course, the flash point will be determined by the "open test."

A rapid method for the determination of the liability of oils to spontaneous combustion has not yet been devised. The "Livache" test may perhaps prove useful for this purpose.

A special apparatus for testing wool oils has been described by Richards. This apparatus consists of an outer shell formed by a six-inch wrought-iron tube, which can be closed at each end by discs of wood. Into this tube is inserted an inner four-inch tube of sheet-iron, with overlapping metal covers at each end. Thus there is left an air space of one inch around the inner tube, and of three inches at each end. The whole apparatus is conveniently placed on a tripod, and heated by a Bunsen burner. Three thermometers, which are inserted into the inner shell through the outer one, allow the temperature to be read. To test an oil, 50 grms. are evenly distributed over, say, 10 grms. of cotton waste, and the waste carefully pushed into one end of the inner tube, and a thermometer inserted into the middle of the ball. A second ball of unsoiled waste is placed similarly at the other end of the tube. On heating, the thermometer inserted into this blank waste should not rise above 100°–101°C., which can be easily controlled by the readings of the middle thermometer. The latter should be kept at about 115°C.

During the last few years Mr. Mackey has paid a great deal of attention to the question how best to determine the liability to spontaneous combustion. He has published several papers in the *Journal of the Society of Chemical Industry*, and has designed an apparatus which is less complicated than the apparatus just described. If once generally adopted, uniform results are sure to be obtained.

In conclusion, a number of objections that must be raised to the schedules of the Fire Insurance Companies were pointed out. In the first instance, neatsfoot oil or tallow oil is not allowed, or, at any rate, has been omitted. Surely, if lard oil is allowed, neatsfoot oil should have found a place in the list. This omission seems all the more strange as fish oil is permitted, which the author does not think a safe oil to use.

Reverting to neatsfoot oil, he mentions that in a comparative set of experiments instituted side by side with pure olive oil and with neatsfoot oil he had been able to prove that neatsfoot oil spread over wool causes a smaller rise of temperature than olive oil. Indeed, this seems but in conformity with theory, since olive oil contains several per cent. of fatty acids belonging to a less saturated series than oleic acid, whereas such acids are absent from neatsfoot oil.

The highest rate is charged for cottonseed oil, and quite rightly so, but as fish oil is allowed, one cannot help asking the question how the analyst is to detect cottonseed oil in presence of fish oil, which may be added to any extent according to the first schedule.

The principle on which the charges are based rests on the amount of unsaponifiable matter, and as this is solely tested for, there seems to be a premium placed on the addition of colophony, the resin acids appearing, of course, as so much saponifiable matter. The wool oil merchant has not been slow to see his chance, and the consequence is that we have in the market a number of wool oils containing a considerable amount of resin acids. It is needless to add how objectionable resin acids are in a wool oil.

It is generally known that the Insurance Companies will reply that mineral oils help to spread a fire when once it has started, and that since the new rules have been introduced the number of fires has decreased, but this is an argument of the order of *post hoc ergo propter hoc*, and is bad in logic, for it ignores a host of circumstances which simultaneously led to better qualities of oil being put on the market.

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

- Retorts for the Destructive Distillation of Carbonaceous Material. A. C. Thomson. 9,944. May 11.  
 Using Chlorine and Sulphurous Acid or their Hydrates as Disinfectants. R. N. Lennox. 10,067. May 12.  
 Treating Gold-bearing Antimony Ores. J. Jones. 10,097. May 12.  
 New Fertiliser and Process of Manufacture for same. O. J. Blunden. 10,109. May 12.  
 New Gas Making Retort. J. E. Tolson. 10,177. May 13.  
 Manufacture of Paints, Colours, &c. H. Rudge. 10,181. May 13.  
 Obtaining Caustic Alkalies from Alkaline Aluminates, and Hydrate of Barium and Aluminium from Barium Aluminate. D. A. Peniakoff. 10,252. May 13.

 Obtaining White Starch from Sorgum. C. Friedbein and A. Rosenheim. 10,330. May 14.  
 Apparatus for the Manufacture of Ozone. E. Andreoli. 10,372. May 14.  
 Improvements in Tanning Apparatus. A. Levinstein. 10,390. May 14.  
 Neutralising Water by Making it Harder or Softer, according to requirement. J. T. Norman. May 15.  
 Manufacture of White Lead. A. H. Sandiland. 10,462. May 15.  
 Extracting Zinc from Ferruginous Liquors, particularly Copper Works Spent Liquors. J. R. Wyld, J. W. Kynaston, and J. Brock. 10,494. May 15.  
 Making High-grade Superphosphates from Low-grade Phosphates, and a Special Drying Oven for use in the Process. E. Cuyllis. 10,574. May 16.  
 Manufacture of Chlorates of Potassium and Sodium. A. Wolf and W. S. Blythe. 10,577. May 16.

### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS of publication are RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in and Apparatus for the Manufacture or Production of Ozone. M. Otto, 8, Passage Gourdon, Paris. Eng. Pat. 5,195, March 7, 1896.

The elements consist of very thin perforated sheets of aluminium, tin, zinc, or other suitable metal placed between two plates of glass. These elements are arranged in a box-like container in a zigzag fashion, so that the oxygen or air to be ozonised passes backwards and forwards through the apparatus, finally escaping at an outlet opposite to the entrance. The general arrangement is, therefore, very similar to that usually adopted. The chief novelty attaches to the production of electric "resonance" to effect the production of the ozone. The transformer is operated by an alternating current dynamo. During the operation of the apparatus the armatures (the plates of metal in the elements) are periodically brought to equal potentials and opposite signs, so as to cause an oscillatory discharge, and there is thus produced a very perceptible "resonance," so that sparks can be drawn from all conducting bodies in the vicinity of the apparatus. The shape of the armatures can be varied, as they may be recessed or made in the shape of a grating, the latter form being that represented in the seven figures that are attached to the specification.

Improvements in the Manufacture of Artificial Stone. E. M. Arndt, 53, Frauen Strasse, Stettin, and G. de Bruyn, 48, Hirschgraben, Hamburg. Eng. Pat. 12,242. June 24, 1895.

The idea of converting a mixture of gypsum and caustic lime into a solid mass by treating with sulphuric acid has not been successful in practice. In this invention the desired change is effected by means of sulphurous acid or a sulphite, the change being facilitated by subsequent immersion in hot water. The stone so obtained is said to be unaffected by moisture, and not to undergo chemical change. To carry out the process, cinders, or sand and slag, are stirred up in water with gypsum, and a mixture of milk of lime, sulphite of aluminium, and sulphuric acid added. For the latter a mixture of milk of lime and free sulphurous acid may be substituted. The mass, after well stirring, is poured into moulds, and allowed to set for about a day. It is then treated with hot water, which is either poured on the stone or the latter dipped into the water. The proportions of gypsum, lime, and sulphite of aluminium are varied for certain special purposes, hydraulic lime being substituted for part of the gypsum. The amount of sulphurous acid added depends upon the amount of lime present, the latter being used in smaller quantities, when silicic acid is added. The order in which the materials are mixed is not of importance.

Improvements in the Manufacture of Artificial Stone. W. P. Thomson, 6, Lord-street, Liverpool (communicated by La Société Anonyme La Néo-Litho, of Moll, near Antwerp). Eng. Pat. 3,800. Feb. 19, 1896.

The object is to make artificial marble by treating certain oxides, notably those of aluminium and potassium, with steam under pressure. It is claimed that the finished product is stronger than natural marble and unattacked by acids. To prepare a greyish marble for building purposes, the following mixture is employed:—40% silica, 20% hydraulic lime, 20% alumina, 10% oxide of potassium, and 5% each of quicklime and ferric oxide. These are finely pulverised, bolted, well mixed, and then subjected to the action of high pressure steam in detachable moulds.

Improvements in and Relating to the Manufacture of Solutions of Zinc Chloride and other Metal Chlorides. C. Hoepfner, 2, Helgoländer Ufer, Giessen. Eng. Pat. 3,449. April 29, 1895.

Blende is roasted to remove sulphur, and the resulting oxides treated with sulphurous acid. Any free acid is neutralized and the zinc sulphite decomposed with calcium chloride solution, with the formation of zinc chloride and calcium sulphite. The chloride, after being freed from traces of sulphite and other metalliferous impurities, is electrolysed to form pure zinc and chlorine. The sulphite of lime can be converted into bisulphite, and used in the manufacture of wood pulp. Instead of zinc, other metallic salts, such as chlorides of iron, nickel, and cobalt, can be obtained.

An Improved Means for Treating Sewage and the Like. J. J. Hood and A. G. Salamon, both of 1, Fenchurch-avenue, London. Eng. Pat. 11,297. June 13, 1895.

Weldon mud is employed for the purification of sewage. For this purpose it is used in the wet state, the mud being debased (*i.e.*, the CaO and MnO being removed) according to the requirements of the sewage. For another form of application for dry closets, the calcium chloride is removed, and the mud dried until it assumes the form of a fine dry powder. Even in this state it contains a lot of water, the composition being about 25 parts of MnO<sub>2</sub>, 9 of MnO, 6 of CaO, and 60 of water. The powder is further dried until it has lost about a third of its water. It is then in a state of very fine division, and has the property of absorbing gaseous emanations and deodorising the same in a most striking fashion.

## Selected Correspondence.

### THE FATAL ACCIDENT AT BLACKLEY.

*To the Editor of the Manchester Guardian.*

Sir,—In your issue of the 22nd inst. you report that Mr. Schwann, M.P., asked the Home Secretary questions in regard to the lamentable death of one of our workmen, and whether he would cause inquiries to be made as to whether the tank was properly protected; if not, as to the responsibility of the manager and the inspector, &c. Now we may be wrong, but it appears to us that Mr. Schwann might have saved the time of Parliament if he had taken the trouble to read the proceedings at the inquest, the evidence of witnesses and of the factory inspector, the coroner's remarks, and the verdict of the jury, which are all fully reported in the local papers of the district which he represents. Poor Henry Bruckshaw met his death not by falling into a tank of vitriol, as Mr. Schwann states, but by jumping from a protected stage into a tank containing boiling salt liquor, the stage being three feet higher than the tank. Unfortunately one of the men had taken some of the planks away the night before without replacing them, and Bruckshaw, no doubt believing them to be in their place, fell into the boiling liquor. It was proved at the inquest that proper steps and gangways are provided and all necessary precautions taken to prevent accidents, and that the unfortunate man, for a shorter cut, discarded these precautions, and instead of returning by the proper exit jumped into the tank—Yours, &c.,  
 (For Levinstein, Limited)  
 JOHN WILSON, Secretary.

FORTHCOMING PUBLICATIONS.—Messrs. Macmillan and Co. have just ready for publication an English translation, by Mr. D. E. Jones and Mr. G. A. Schott, of a volume of miscellaneous papers by Heinrich Hertz, the young German physicist, whose remarkable researches in electricity were unhappily cut short by his premature death. This volume contains mainly his earlier investigations, which have hitherto been difficult of access. The introduction by Professor Lenard includes extracts from Hertz's letters to his parents, which throw interesting light upon the course of his scientific development. Professor William Ramsay's book on the gases of the atmosphere, which will contain the first popular account of the discovery of argon, will also be published immediately by Messrs. Macmillan. It will contain portraits of the chief investigators in this branch of physics.

## Reports of Companies.

### SAN JORGE NITRATE CO., LTD.

#### THE WORKING OF THE COMBINE.

At the meeting of this company last week, the chairman (Mr. R. Harvey) made the following interesting statement concerning this company and the working of the Nitrate Combine. He said: I need hardly tell you that had we chosen we could have produced as much nitrate in 1895 as we did in 1890, and have made a correspondingly larger profit, but we preferred economical working to sensational results; we preferred keeping on a steady rate of progress, and at the same time we took advantage of the occasion, and worked out pieces of ground that had been partly worked before—ground which we could work and still make a fair profit at those prices, but which it would not probably have paid to work during a time of restricted output, and in consideration of these measures we have lengthened the life of the officina by working up partially used ground, and we have effected what I am sure we must consider a very splendid result. That we have as good caliche at San Jorge as any which has ever yet been extracted is satisfactorily proved and demonstrated to us by our cable advices for April. Our output for that month was in excess of that of any previous month since the formation of the company, and the cost of production was lower than in any other month for the last two years, notwithstanding the great rise in the Chilean exchange, which would make the manufacture of nitrate much dearer than in the year before. That, I think, is a fact that you should consider highly satisfactory. I venture to believe that very few other nitrate works can speak of their results in the same strain. (Hear, hear.) As you know, the combination for the restriction of the output has been formed, and on the basis of last month, this month, and the following month our quota of production will be fixed for the next three years. We are pleased to be able to tell you that the combination is at last formed, and although it is for a limitation of the output only, yet it will enable us and is enabling us to get the maximum of the profit for a minimum of expenditure on our grounds. At the same time, I must say—and in this my colleagues as well as a great many others who are interested in the nitrate business are with me—that the combination for the limitation of output is not yet a complete combination, because competition in sales still exists, and in order to preclude that all nitrate should be consigned to one central house or to one person, so that all sales should be made through one hand. That would do away with the competition that now exists. Notwithstanding the limitation of output, nitrate to-day is about £8. per ton, and each producer wishes to sell his own production, while £9. per ton could easily be procured were it all sold through one hand, and £11. 00,000. sterling more could be divided amongst the different nitrate-producing companies if that were done.

The combination has limited the output from the month of March, 1896, to March, 1897, to about 20,000,000 quintals, or a little over 1,000,000 tons, and were nitrate at £9. per ton the consumption would be equally as great as at the present time, and nitrate would still be very cheap to the consumer, while we could make, as one of the producers, £1. per ton more than we are doing at present. I merely mention that so that you may know exactly the condition in which the combination for the limitation of the output stands.

### SANTA RITA NITRATE CO., LTD.

The seventh annual general meeting was held last week at Winchester House, Mr. H. W. Lowe presiding. In moving the adoption of the report the chairman stated that for the period under review the net profit, together with the sum brought forward, amounted to £15,176., out of which the board recommended the payment of a dividend of 10 per cent. per annum, leaving £5,546. to be carried forward. The past twelve months had been full of difficulties and anxieties for all associated with the nitrate trade, owing to the low prices and over-production consequent on the lapse of the combination which existed during the preceding three years. In 1894, when the combination was in force, their output was restricted to 13,200 tons, but last year they produced 15,000 tons, and could have turned out a larger quantity had they thought it advisable to do so. Now that the combination had been renewed he thought there should be no difficulty in increasing their profit, and, in the absence of any unforeseen circumstances of an adverse character, the results of the current year's working ought to show a satisfactory improvement. For the moderate price of £25,000. they had acquired the neighbouring officina and grounds of Carolina, which comprised 258 estacas. In order to provide funds for the acquisition of this property and the requisite additional working capital, an issue of £35,000. of 6 per cent. first mortgage debentures, redeemable within ten years had been made. As the result of the purchase in question, it was estimated that the company's output would be considerably increased, combined with a large saving on the present cost of production. Mr. J. M. Clarke seconded the motion, and the report was adopted.

### CONSOLIDATED NITRATE CO., LTD.

The ordinary general meeting was held on Wednesday last week the offices, 43, Lothbury, Mr. Nugent Hargrave presiding. In moving the adoption of the report, the chairman remarked that the result of the past year's working was not so satisfactory as that of the previous year. During the period under review their net production of nit was only about 261,000 quintals, as compared with 462,500 quintals in 1894, and the prices obtainable were also very low. In fact, there had been a crisis in the nitrate trade, but he was pleased to say that they were now looking better. The combination of nitrate producers which had been in force since April 1st last would continue for three years certain, and it might be prolonged indefinitely. A large iodine combination had also been formed on a more solid basis than previous there being no outsiders at the present time, and they therefore expected very successful results in the future. In conclusion, he stated that the board recommended the payment of a balance dividend of 2 per cent. making 5 per cent. for the whole year. Mr. Bowlby seconded the motion. Replying to a shareholder, the chairman said the iodine combination would expire on April 1st, 1897, but unless it was denounced by October 1st next it would go on automatically for 1 years longer. As it was a condition of membership of the nitrate combination that everyone should join the iodine combination, he did not see how it could be denounced. The report, including the dividend therein proposed, was adopted.

### MESSRS. J. C. AND J. FIELD.

The directors, in their report for the year ended March 31st, state that the profits made during the year compare favourably with those of the preceding year, and, after providing for repairs and depreciation of plant and machinery, amount to £20,328. After deducting interest paid and accrued on the debentures, managing director's and directors', trustees', and auditors' fees, and expenses of secret department, there remains a net profit of £16,087., to which has been added £576. brought forward from the last account, making a disposable balance of £16,664. Out of this sum the board recommends payment of a dividend in full on the seven per cent. preference shares and on six per cent. preference shares, and a dividend of 5 per cent. on ordinary shares, free of income tax. Four thousand pounds is written off goodwill, trade marks, &c., and £1,500. is placed to reserve, leaving £591. to be carried forward.

### SAN DONATO NITRATE CO., LTD.

The directors' report for the twelve months ended December 31st states that the profit and loss account shows a net balance of £3,554. Adding the balance from last account, £30,151., and deducting the amount carried to reserve fund, £9,000., and to depreciation fund, £5,000., and the amount of a dividend of 2½ per cent., remains to be carried forward to next account, pending the settlement of the claim against the Chilean Government for \$80,344.50., a balance of £15,706. The directors regret that, owing to the low price of nitrate during the past year and the fact that the officina worked nine months and a half, they are unable to present a favourable balance sheet, or to recommend the payment of a dividend.

#### DIVIDENDS.

*San Sebastian Nitrate Co., Ltd.*—The report for the year ended December 31st, 1895, shows a net profit, including £3,082. brought forward, of £3,594, which is carried forward.

*G. Kynoch and Co., Ltd.*—The Board have resolved:—"Subject to the final audit of the accounts for the financial year ended on April 2nd, 1896, the payment of a dividend at the rate of 10 per cent. per annum on the preference shares, and a dividend at the rate of 13 per cent. per annum on the ordinary shares, both free of income tax be recommended."

**THE DURHAM COAL TRADE COMBINATION.**—It is now officially that the amalgamation scheme in the Durham coal trade has been carried into effect. The undertaking (a Sunderland correspondent writes) is probably the most important ever carried out in the history of the coal trade. By the terms of the transfer the Earl of Durham disposed of the whole of his collieries, fourteen in number, his fleet of steamers numbering nineteen, together with the railways, the plant, and miners' houses, to Messrs. Joicey and Co., Limited. The latter firm are now the owners of 27 collieries and close upon 100 steamers. The production is, approximately, four million tons of coal per annum, and when the steamers are taken into account, the number of hands employed will not fall short of twenty thousand. The head of the firm is Sir James Joicey, M.P. for the Chester-le-Street Division of Durham. The company will now be the largest firm of coalowner and coal shippers in the country, and will exercise a controlling influence in the Durham coal trade. The purchase money has been stated at a million sterling.

## THE VOLUMETRIC ASSAY OF COPPER.

THE following description of a modification of the iodine method of assaying copper, as given by Dr. Peters in his work on modern copper smelting, has been contributed to the *Journal* of the American Chemical Society by Mr. A. H. Low. He says:—

For the most accurate technical work I prefer it to all other methods. For practical work it exceeds the electrolytic method in accuracy, notwithstanding that the latter, when every precaution is taken, is perhaps theoretically more accurate.

### COPPER ASSAY BY THE IODIDE METHOD.

Prepare a solution of sodium hyposulphite containing about 19 grams of the pure crystals to the liter. Standardize as follows: Weigh accurately about 0.200 gram of pure copper foil, and place in a flask of about 250 c.c. capacity. Add 5 c.c. of a mixture of equal volumes of strong nitric acid (1.42 sp. gr.) and water, and thoroughly boil off the red fumes—a very essential point. Now remove from the lamp, and add 6 to 7 grams of crystallized zinc acetate, roughly weighed, and about 15 c.c. of water. Instead of adding the zinc acetate in this way, a cold saturated solution may be kept on hand, and about 20 c.c. taken, the additional 15 c.c. of water being then unnecessary. Heat to boiling for a moment and then cool to ordinary temperature, and dilute to a bulk of about 50 c.c. Now add three grams of potassium iodide and shake it about gently until dissolved. Cuprous iodide will be precipitated and iodine liberated according to the following reaction:  $2(\text{Cu}_2\text{C}_2\text{H}_3\text{O}_6) + 4\text{KI} = \text{Cu}_2\text{I}_2 + 4(\text{K}_2\text{C}_2\text{H}_3\text{O}_6) + 2\text{I}$ . The free iodine colours the mixture brown. Titrate at once with the hyposulphite solution until the brown tinge has become weak and then add sufficient starch liquor to produce a marked blue colouration. Now continue the titration cautiously until the blue tinge has entirely vanished. When almost at the end allow a little time after the addition of each drop to avoid passing the point. One c.c. of the hyposulphite solution will be found to correspond to about 0.005 gram of copper. In the assaying of ores, &c., when half a gram is taken, one c.c. of the standard hyposulphite would then equal about one per cent copper. The reaction between the hyposulphite and the iodine is:  $2(\text{Na}_2\text{S}_2\text{O}_3) + \text{I}_2 = 2\text{NaI} + \text{Na}_2\text{S}_4\text{O}_6$ . Sodium iodide and tetrathionate are formed. The starch liquor may be made by boiling about half a gram of starch with a little water and diluting with hot water to about 250 c.c. It should be used cold and must be prepared frequently for regular work, as it does not keep very well. The hyposulphite solution made of the pure crystals and distilled water appears to be very stable, showing no appreciable variation at the end of a month, when kept under reasonable conditions.

### TREATMENT OF ORES.

Treat half a gram of the ore in a flask of 250 c.c. capacity with five or six c.c. of strong nitric acid and boil gently nearly to dryness. Then add five c.c. of strong hydrochloric acid and again boil. As soon as the incrustated matter has dissolved add five c.c. of strong sulphuric acid and heat strongly, test by manipulating the flask in a holder over a small naked flame, until the more volatile acids are expelled and the fumes of the sulphuric acid are coming off freely. Allow to cool and then add 20 c.c. of cold water and heat the mixture to boiling to thoroughly dissolve any anhydrous sulphates of iron, &c. Now filter to remove more especially any lead sulphate and receive the filtrate in a beaker about two and one-half inches in diameter. Wash the flask and filter with hot water and endeavour to keep the volume of the filtrate down to about 50 or 60 c.c. Place in the beaker two pieces of sheet aluminium, which, for the sake of convenience in subsequent washing, may be prepared as follows: Stout sheet aluminium, say about one sixteenth of an inch in thickness, is cut into pieces an inch and a half square, and then the four corners are bent, for about a quarter of an inch, alternately up and down at right angles. This scheme prevents the pieces from lying flat against each other or upon the bottom of the beaker, and their washing is thus facilitated. The same pieces of aluminium may be used repeatedly, as they are but little attacked each time. Add five c.c. of strong sulphuric acid, cover the beaker and heat to boiling. Boil strongly for about seven minutes. Unless the bulk of the solution is excessive this will be quite sufficient with all percentages of copper. Ordinarily the aluminium will be found to be clean and nearly or quite free from precipitated copper. If, by chance, the copper adheres to any considerable extent, it will usually become loosened by a little additional boiling, or it may be removed by the aid of a glass rod. Transfer the solution back to the original flask, and, by means of a wash bottle of hot water, rinse in also as much of the copper as possible, leaving the aluminium behind. Drain the beaker as completely as possible and temporarily set it aside with the aluminium which may still retain a little copper. Allow the copper in the flask to settle and then decant the liquid through a filter. Again wash the copper similarly two or three times with a little hot water, retaining it as completely as possible in the flask. Finally wash the filter once or twice and endeavour to rinse all metallic particles

down into the point. Now pour upon the aluminium in the beaker five c.c. of a mixture of equal volumes of strong nitric acid (1.42 sp. gr.) and water and warm the beaker gently, but do not heat to boiling, as the aluminium would be thereby unnecessarily attacked. See that any copper present is dissolved and pour the warm solution through the filter last used, thus dissolving any contained particles of copper, and receive the filtrate in the flask containing the main portion of the copper. At this stage do not wash either the aluminium or the filter, but simply remove the flask and set the beaker in its place. Heat the mixture in the flask to boiling, and see that all the copper is dissolved. Then add about half a gram of potassium chlorate and again boil for a moment. This is to oxidise any arsenic present to arsenic acid, and is a very important point. Remove the flask from the lamp and again place it under the funnel and wash the beaker, aluminium and filter with as little hot water as possible. Again boil sufficiently to remove every trace of red fumes. All the copper is now in the flask as nitrate. Add the zinc acetate, and proceed from this point precisely as described with the original nitrate of copper solution in the standardisation of the hyposulphite, finally calculating the percentage of copper present from the amount of standard hyposulphite required. One point, however, remains to be further explained. According to the equation previously given, half a gram of pure copper requires 2.62 grams of potassium iodide. While direct experiment shows this to be apparently true, yet it is found that with small percentages of copper, the reaction, when only the theoretical amount of potassium iodide is taken, is slow, and in fact does not appear to proceed to completion until during the titration, which is thereby unduly prolonged. It is therefore best to use not less than three grams of potassium iodide in any case. An excess does no harm. Silver does not interfere with the method. Lead and bismuth are without effect, except that by forming yellowish iodides they may mask the end-point before adding starch. Lead is practically removed as sulphate at a previous stage. If bismuth is suspected in any appreciable amount, simply add the starch earlier in the titration. Arsenic when oxidised as described has no influence. The return of the blue tinge in the liquid by long standing after titration is of no significance, but a quick return of the colour, which an additional drop or two of the hyposulphite does not permanently destroy, may indicate either an incomplete combination of all the nitric acid with zinc, or a failure to completely boil off the red fumes when dissolving the copper in nitric acid. The assay in such a case is spoiled. This trouble may be avoided by carefully following the directions given and not guessing at strengths or quantities. The amount of zinc acetate recommended is a safe excess. Sodium acetate does not appear to work as satisfactorily.

For the assay of alloys, &c., the necessary modifications of the foregoing scheme are obvious.

The foregoing scheme directs the use of five c.c. of dilute nitric acid for dissolving the copper previous to titration, and prescribes six to seven grams, or about twenty c.c. of a saturated solution of zinc acetate as a safe excess of neutralising agent. It is obvious that if most of the nitric acid be boiled away the amount of zinc salt necessary is greatly reduced. In such a case, however, it is perhaps best, for safety's sake, not to use less than one-half the prescribed quantity. Half the zinc salt may thus be saved at the expense of a little more time. This is the ordinary practice in my own laboratory.

## PROTECTING PETROLEUM TANKS.

THE destruction by fire of the petroleum tank storage at Harburg in May last year has directed attention to the subject of petroleum tanks, and the danger likely to accrue to the community from their situation in inhabited districts. The report on the Harburg fire, drawn up by M. Albrecht, tended, however, to dissipate the alarm at first occasioned by the catastrophe, by bringing to light the fact that the fire was not due to any specific danger inherent to the use of tanks for storage, but to defective appliances whereby a large volume of an explosive mixture of gas and air was enabled—under the favourable atmospheric conditions, viz., absence of wind, prevailing at the time—to collect above the cover of the tanks, and facilitated—or, at least, did nothing to hinder—the passage of flames ensuing, when the mixture was ignited by lightning, into the interior, and so firing the inflammable gaseous mixture existing therein above the surface of the oil.

In considering how similar accidents can be guarded against, Dr. R. Kissling says three main questions arise, viz., how can the tanks be protected against ignition: (1) by lightning (2) by communicated flame from another fire, and (3) how may the danger of explosion be obviated? For the proper understanding and appreciation of the last question it must be recollected that the air space above the oil is filled with a mixture of gaseous hydrocarbons and air, the proportions of which mixture are liable to continual variation from the expulsion of mixed gas and the inflow of air occasioned by the alternate expansion and contraction due to changes of temperature. To return to the protection

of tanks from lightning, it is requisite that an efficient installation of conductors must be provided. This can be carried out most suitably by the erection of four rods about 30 feet long, connected at about 16 feet above the lid of the tank by a copper cable of appropriate diameter; this will divert the course of a flash striking between the vertical rods. The system should be grounded to a network of pipes—gas or water pipes—or else to a copper plate of suitable dimensions sunk in the soil water, particular care being taken that all the connections are sound and protected by an efficient covering to shield them from atmospheric and other influences. The rods, cable and ground plate will, of course, require to be capacious enough properly to conduct the electric current to earth, and the periodical examination of the condition of the installation is absolutely essential, especial care being needed to see that the weak points, viz., the connections, are in thorough working order. Measuring the resistance by means of the ordinary apparatus is not sufficient to detect other than large faults in this respect.

In the second point under consideration, the object in view is the prevention of the transference of flame from the external air into the gas space in the tank, and the most efficient method of effecting this is by making the ventilator tubes of a U form, the longer limb projecting through the edge of the tank lid downwards for a few feet, and being provided with three partitions of fine wire gauze—120 meshes to the square centimetre. This downward direction of the tubes will prevent the accumulation of heavy hydrocarbon gases on the cover of the tank. The ventilators will need to be of large diameter to allow ready escape of air during the filling of the tank, and may conveniently be enlarged at the points where the partitions are inserted, in order to diminish friction.

The efficiency of this method of protective ventilation has been thoroughly tested on a small scale by the author, who found that the evolved gaseous mixture from petroleum heated in a current of air burned quietly away beyond the gauze interceptors, so long as there was gas to consume, but that notwithstanding the varying proportions of the mixture—from saturation with gas down through the various degrees of inflammability and explosibility to attenuation no lighting back behind the gauze occurred.

So far as reducing the effects of an explosion to a minimum is concerned, the chief precaution to be adopted is to make the tank cover as light as possible, and provide a liquid seal—glycerine or similar fluid—at its junction with the body, taking care that the cover cannot be carried away by the wind, and that it is in electrical connection with the lightning conductors.

## Trade Notes.

**NITRATE OF SODA.**—Messrs. Dobell and Co. report:—"Notwithstanding the falling off in the demand during the past few weeks, owing to the continued dry weather, the market has remained very steady. This is no doubt caused by the completion of arrangements to restrict the output for the next three years. Under this agreement, we are to have shipped to Europe about 350,000 tons less this year than the preceding twelve months, but as the visible supply on the 1st of May was 100,000 tons more than last year, this leaves us with a quarter of a million tons less nitrate to meet requirements up to the end of April, 1897. The deliveries so far this year are 80,000 tons in excess of same period in 1895, and, as beet sugar (owing to the Cuban Rebellion) is realising paying figures, we may safely look for at least a demand equal to the past in which case nitrate will most certainly advance. Already considerably higher prices are asked for forward deliveries. Spot Nitrate: White refined quality is now offered, testing about 3% refraction, at £7. 16s. 3d. per ton; good ordinary 4 to 5% refraction, at £7. 15s. per ton free to carriers, usual terms."

**THE CAUCASIAN NAPHTHA INDUSTRY.**—The naphtha industry in the small town of Grosny, in the Terak district, is rapidly developing, and one large firm springs up after another. The necessary pipe for the conveyance of the naphtha to the nearest railway station, which is a distance of 8½ miles, is being constructed, and the demand for Grosny naphtha increases every day. Of the four leading firms the largest is working six bore-holes, but this number will ere long be increased; the second firm is working a couple of bore-holes, and several other large and substantial firms are gradually getting into full swing. Further, the large firm of Nobel and Co. has bought several plots of land in the neighbourhood of Grosny, in order to employ them in the naphtha industry, the installations being already in course of completion. The Wladikowkos Railway Company has also decided to exploit the naphtha industry at Grosny, and a syndicate of Tiflis and Baku capitalists, which some years ago bought several plots of land in the same district, is now about to commence operations. As an example of the astonishing yield of the Grosny borings, one is mentioned which yielded 13,000 tons of naphtha in 24 hours, a figure which has barely been reached even at Baku.—*Engineering.*

**WEEDS AS MANURE.**—In Switzerland a liquid manure is prepared from weeds by making them into heaps and letting them ferment. When they have gone yellow they are watered with weak sulphuric and hydrochloric acids. The resulting juice contains nitrogen, potash, and phosphoric acid.

**LOCAL AUTHORITIES AND FACTORY SEWERS.**—The Master of the Rolls and Lord Justice Smith were occupied several hours last week in hearing an appeal by the Oswaldtwistle Urban District Council from an order of Mr. Justice Kennedy, raising an important point as to the liability of District Councils in reference to making provision for carrying off sewage water from factories. The late Mr. Peebles sought to obtain a *mandamus* against the District Council, requiring them under the Public Health Act of 1875 and the Rivers Pollution Act of 1876 to give him facilities for turning liquid refuse from his manufactory into the sewer. Mr. Peebles dying, Mr. Justice Kennedy, on application to him, ordered that his executors might be joined in the cause as plaintiffs. This was now appealed against by the District Council, on the ground that the action was not for damages, but only to enforce an omission, and the executors could not sue except as representing the estate in damages. The appeal was dismissed, with costs.

**CHEAP ICE CREAMS AND FOUL WATER.**—Mr. F. Durant, chairman of the St. Pancras Public Health Committee, in a report issued the other day states that, upon analysis of three samples of the water in which ice cream glasses were washed, it was found that they contained respectively 4,200,000, 2,150,000, and 5,340,000 putrefaction bacteria per cubic centimetre, as against rarely more than 100 bacteria in a cubic centimetre of good drinking water. Hence, not only were the cheap ice creams vended in the streets, and mostly consumed by juveniles, frequently unwholesome because of the objectionable materials of which they were composed, but the water used by the vendors in connection with their business was very often foul. The St. Pancras Health Committee, having fully investigated the facts of the case over a wide area, hold that the present state of affairs "undoubtedly constitutes a source of danger to the health of the children of the poorer classes, by whom the objectionable ice creams are mainly consumed." The Committee consider that it is clearly necessary to control the street sellers of the ice cream in their occupation, and they have requested the Local Government Board to promote legislation providing for the registration of these ice cream vendors, and for the regulation of the trade by by-laws and proper supervision of the manufacture and supply of ice creams.

## FOREIGN REMITTANCES.

Owing to the inconvenience created by the various ways in which foreign subscriptions are remitted, we respectfully beg to inform subscribers that a *Crossed MONEY ORDER* is the most satisfactory method of remitting, both for them and ourselves. In the case of a Money Order, a letter advising us of same should always be sent, otherwise, owing to post-office formalities, much delay in tracing and acknowledging foreign remittances is inevitably entailed in this country.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols continue steady, at 2s. 4½d. for 90's, and 2s. to 2s. 1d. for 50/90's prompt. For July-December, 90's are quoted 2s. 3d. to 2s. 4d. There is no change in carbolic acids; the prices of both 60% crude and 40% crystals remain as last quoted. Crude naphtha stands at 8d., and solvent is the turn better, at 1s. 3d. Anthracene, 30% A, 10½d.; B, 9d. Creosote, 1d. Pitch, 32s. to 32s. 6d., L.A.B. East Coast.

Sulphate of ammonia is firmer, in sympathy with the improved demand which has picked up, notably in forward. There is no spot quotation for Beckton. London outside makes remain at £8. 2s. 6d. Liverpool is now quoted £8. 2s. 6d., Hull £8. 2s. 6d., and Leith £8. to £8. 1s. 3d., the latter being asked by the majority of holders. For forward at Hull £8. 2s. 6d. is being asked.

### REPORT ON MANURE MATERIAL.

Owing to the holidays there is very little doing, and there is nothing particular to report upon. Quotations for mineral phosphates are unchanged, without any fresh business to report. For summer-autumn shipments the value of River Plate bones is about £3. 15s. per ton, delivered, good, U.K. ports, but for large cargo now afloat 2s. 6d. per ton less would no doubt be accepted if bid. Retail business is being done in Bombay bone meal at about £3. 15s. per ton on spot. Nothing further is reported to arrive, but it is understood that prices recently accepted would not now do. Fine crushed Kurrachee bones offer at £3. 17s. 6d. ex quay, without finding buyers. Nitrate of soda is quiet on spot, at 7s. 10½d. per cwt. for ordinary, and 8s. per cwt. for refined.

## ISCELLANEOUS CHEMICAL MARKET.

Business in the alkali trade during the past week has been rather quiet, and prices on the whole remain unchanged. Ammonia alkali, £3. 7s. 6d. per ton, bags, f.o.b. Leblanc soda ash, 1d. to 2d. per degree, in casks, f.o.b. Soda crystals 35s. per ton, bags, f.o.b. For caustic soda there is a demand at the ruling prices, which for spot and forward delivery may be taken as follows:—f.o.b. Liverpool, 77%, £9. 7s. 6d. to £8. 7s. 6d. per ton; 70%, £7. 7s. 6d.; 60%, £6. 7s. 6d. to 10 ton lots upwards. Bleaching powder in fairly good request, at £6. 15s. to £7. per ton, f.o.b. Chlorate of potash quiet, at 4½d. per lb. Soda, 6d. Yellow prussiate of potash is said to be a little firmer at 7½d. per lb. Sulphocyanides unchanged. Sulphate of copper firm f.o.b. There is no change in the position of acetates of lime, grey, and prices are unaltered; values of other acetates continue, but prices are steady. Muriate of ammonia rather easier at 8s. For white powdered arsenic the continued good demand for supply maintains price at £23. to £24. for spot delivery, and forward. Nitrate of soda remains firm at 8s. to 8s. 3d. per cwt. Midlands, owing to the holiday week, business is more or less quiet.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

—Palm oil is quiet and steady. Business is scarce, small quantity reported in Lagos at £18. 10s. and soft oils £17. 10s. per ton in transit. Olive is steady, and the demand fair considering the price. Linseed is rather dull, with Liverpool at 19s. 6d. to 20s. 6d., in export casks. Cottonseed is quoted at 17s. 3d. for Liverpool refined, and 17s. per cwt. for American. It is steady and unaltered. Tallow is neglected, there being no doing. Resin: Common, 4s. 9d. to 5s.; medium, 5s. to 5s. 1d. fine, 6s. to 7s. 3d. per cwt. Spirits of turpentine steady, but quiet, at 22s. 3d. per cwt. for spot sales. Petroleum: American, 7½d.; Russian refined, 5¾d. per gallon.

OURS.—Prices are steady, and practically without change.

Oxfordshire, common, £10., medium, £12., best, £15. 10s. 6d., common, 40s.; medium, 50s., best, 60s.; Welsh, best, 60s., and common, 18s.; Irish, Devonshire, 40s. to 50s. French, J.C., 65s. Umber: 40s. to 45s. White lead, £16. 10s. unchanged. Venetian red, £6. to £10. Cobalt: Pre-oxidized, 9s. 9d.; black, 9s.; blue, 6s. Oxide of iron: Common, medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## LIVERPOOL MINERAL MARKET.

During the last week our market has ruled very brisk. Manganese: Stocks are nil; stocks are exhausted, and prices are strong; forward prices are slow, and higher prices are sought. Ground manganese ore, the demand continuing good at £6., £8., £10., and £12. per ton, according to quality. Manganiferous iron ore is in demand. Chrome ore: There have been more arrivals, and prices are steady. Bauxite: The demand continues good, and prices are steady for firsts, 16s. for seconds, and 12s. for third. French chalk: Arrivals have somewhat improved, but we are scarcely keeping pace with the demand, especially for the higher prices for "Angel White" brands are steady at 65s. to 70s., 90s., and 100s. per ton, according to grade, with an upward tendency. Wolfram and scheelite: Stocks are nil; prices considerably advanced, and there is a strong inquiry for forward delivery. Ferro-chromium and ferro-tungsten are unaltered. Arsenic: Demand at full prices, £23. per ton being done for small lots. Emerald is steady at late price, "Emerald" and other brands of emerald at 50s. for lump, 55s. for ground, and 75s. per ton for fine powder. Ochres and umbers remain unaltered, a fair quantity being done at 60s. for J.C. ochre, and 40s. for prime umber. Stone is in more request, prime Teneriffe being done at 10s., Italian lump at £10. 10s., and ground at £6. 10s. per ton. Feiselguhr meets with a steady sale at last prices. Asbestos and mica firm at unaltered prices. Bog ore is steady with alteration in business being done at 22s. 6d. to 25s. per ton. Magnesite sells at prices being somewhat easier. Plumbago is in fair demand at £10. per ton for prime foundries and lubricating qualities. Ceylon being done at £15. to £20. per ton. Carbonate and barytes are quiet. Fluorspar is in quiet demand. Feldspar is quiet. The inquiry for molybdenite, cerite, euxenite, ytterite, etc., is quiet.

## THE METAL MARKET.

LONDON, WEDNESDAY.—Pig iron, nominal: Scotch warran closed at 46s. 10d.; Middlesbrough, 37s. 8d. cash, and hematite, 47s. 8d. Copper, steady: Chili bars, G. O. B.'s and G. M. B.'s, closed at £46. 16s. 3d. to £47. 1s. 3d. cash, and £47. 2s. 6d. to £47. 7s. 6d. three months. Tin, steady: Straits closed at £60. 7s. 6d. to £60. 17s. 6d. cash, and £60. 17s. 6d. to £61. 7s. 6d. three months; Australian, £61. 15s. English ingots, £64. to £64. 10s. Lead, firm: Spanish, £11. 2s. 6d.; English, £11. 5s. to £11. 7s. 6d.; Silesian spelter, ordinary, £17. 13s. 9d. Nickel, 1s. 2½d. Antimony, £30. 5s. Quicksilver, dull: First hands, £6. 15s.; second hands, £6. 14s. Copper shares, steady but quiet: Cape, 2½ to 2½; Copiapó, 2½ to 2½; Libiola, 2¾ to 3; Mason and Barry, 3 to 3¼; Rio Tinto, 21½ to 21½; Tharsis, 5¼ to 5½.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

Since last writing there has been another slight shift of position in sulphate of ammonia, with a fractional price improvement. It can be bought to-day for £8. spot, Leith, but only from a section of the holders, some others of them standing out for £8. 1s. 3d. Disagreement as to forward terms continues, and no business is done. In general chemicals the feeling is very little changed. Rather easier quotations are talked of for bleaching powder, chlorate of potash, and sulphate of copper. Bichromates are unchanged, and at the old rate makers still concede the right of buying two months in advance, a right which is very generally taken advantage of by dealers, who mostly believe there will be a rise eventually. In mineral oils and solid paraffins quietness continues the rule, the present being the slack season; lubricating oils form the exception, being in good demand, especially for the higher grades, although low grade, 865°, is perhaps a shade easier.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £4. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62° £6. 7s. 6d., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £6. 17s. 6d. nett, Tyne; saltcake, 23s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4½d. less 5%, any port; nitrate of soda, 8s. to 8s. 3d.; sulphate of ammonia, about £8., f.o.b., Leith; sal-ammoniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £18. 17s. 6d. to £19 less 5%, Liverpool; paraffin scale, hard, 1½d. to 1¾d., and soft, 1¾d. to 2d. per lb.; paraffin wax, 120° semi-refined, 2½d. to 2¾d. per lb.; paraffin spirit (naphtha), 7d. per gallon; paraffin oil (burning) No. 1, 6¼d., and crystal, 6½d., at Glasgow and other big centres, for Scotch buyers (English sales ½d. to ¾d. lower); ditto (lubricating) 865° £4. 10s. to £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were nil.

## TYNE CHEMICAL REPORT.

SATURDAY.

In chemicals the trade is slow, but on the whole steady, with fair shipments. Prices are unaltered. Soda crystals, £2. 2s. 6d. per ton, gross weight, locally. Sulphur is scarce at £3. 17s. 6d. per ton. Caustic, 70%, £7. 10s. to £7. 15s. per ton; 76/77%, £9. 5s. per ton.

## Notices.

communications for the *Chemical Trade Journal* should be sent to the Editor, and Cheques and Post Office Orders made payable to—  
**DAVIS BROS., 32, Blackfriars Street, MANCHESTER.**

Our Registered Telegraphic Address is—

“Expert, Manchester.”

NATIONAL TELEPHONE 3060.

Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*,—payable in advance,—including postage, wherever sent, are as follows:—

|                          |          |
|--------------------------|----------|
| Early (52 numbers)       | 12s. 6d. |
| Half-Yearly (26 numbers) | 6s. 6d.  |
| Quarterly (13 numbers)   | 3s. 6d.  |

Subscribers will oblige by making their remittances for subscriptions by Post Office Order, crossed and payable to “Davis Bros.”

Contributors are invited to forward items of intelligence, or cuttings from technical newspapers, of interest to the trades concerned.

Articles, reports, and correspondence on all matters of interest to chemical and allied industries, home and foreign, are solicited. Contributors should condense their matter as much as possible, on one side only of the paper, and in all cases give the names and addresses, not necessarily for publication. Sketches should be on separate sheets.

## Advertisements.

Advertisements of Situations Vacant, Premises on Sale or To be Let, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

|                          |                       |
|--------------------------|-----------------------|
| 30 Words and under       | 2s. 6d. per insertion |
| Each additional 10 words | 6s. 6d.               |

Advertisements of Situations Wanted are inserted at one-half the rates when prepaid, viz.:—

|                          |                       |
|--------------------------|-----------------------|
| 30 Words and under       | 1s. 6d. per insertion |
| Each additional 10 words | 6s. 3d.               |

Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff rates, which will be forwarded on request.

Advertisements intended for insertion in the current week's issue should be sent to the office by **Thursday morning** at the latest.

## CURRENT TOPICS.

### THE CARRIAGE OF EXPLOSIVES.

THE recently published Blue Book on this subject contains a considerable amount of interesting information about the state of the industry and the cases in which the regulations for the transportation of explosives have been infringed.

The Act is one that has proved exceptionally beneficial. Though there are nine factories at which nitro-glycerine is made and 14 smokeless powder works, there have only been ten fatalities due to accidents during the past twelve months, thus affording a most satisfactory contrast with the number that took place before the inception of the Act.

There are several instructive cases in which certain irregularities in the methods of transport are described, from one of which it would appear that Manchester is not a port authorised for the importation of explosives.

The necessity of strictly enforcing the regulations needs no emphasising, but among some of the cases there is evidence that red-tapeism is at times apt to be allowed to run rampant.

A pointed contrast is to be noted between the recent case against the New Explosives Co. and the record of the procedure followed in dealing with a cargo of bellite imported contrary to regulations.

In the former case though there were extenuating circumstances, it was just as well that the law should be severely enforced. “All's well that ends well” is only true when the risks are run by those who cause them.

It is of the greatest importance that the slightest tendency to laxity in regard to the carriage of explosives should be promptly and effectively checked. Otherwise, although nothing may result nine times out of ten, there is always the risk, the potentiality of which is sufficient on the tenth occasion to lead to an accident similar to the Johannesburg catastrophe.

In the Bellite case the fault lay in the fact that the explosive was imported in boxes, the lids of which were fastened with uncovered screws and nails. Presumably such a condition was dangerous, or, to say the least, risky. The journey fortunately had been safely achieved, and one would think that the authorities would have had the error remedied as speedily as possible, enforcing the importance of the oversight by an adequate fine. On the contrary some mind, hopelessly blinded by officialism, adopted a course which borders, if not more than borders, on the ludicrous. The consignment was ordered back to the port of origin, so that it might then be properly packed and once more despatched. A fine equal to the cost of the double journey and re-packing would have been just as impressive, much safer, and far more consistent with the spirit and aim of the regulations.

### SCIENCE AS AN AID TO AGRICULTURE.

The growing depression in the agricultural industry has formed the text of so many homilies during the past few

months, from so many sources and such diverse aspects, that there is little left to be said, and very few who want to hear even that little. It is now beyond doubt a case in which self-help is most wanted and least exercised. In the midst of all the turmoil about rates, tithes, and reduced tents, science keeps steadily on, contributing mite after mite to the now respectable store of knowledge that has been garnered for the benefit of the next generation of farmers, if such a *genus* will exist then. It is with one of the latest of these contributions, which is of decided interest to the chemical trade, that we shall concern ourselves, and leave the moral to be pointed by those who have time to cast metaphorical pearls before hyperbolic swine by giving good counsel to the irreparably ignorant.

It is well-known that the chief drawback to the forms of nitrogenous fertilizers most popular at the present time is the liability to be washed out of the soil, so that in many cases if anything happens to the crop, practically all the fertilizer is lost, as well as having been used to no purpose. An ideal fertilizer would therefore be one which would only decompose slowly to form ammonia, and at the same time be insoluble. Advantage has apparently been taken of the properties of silicon nitride, which are favourable to the achievement of the desired end. This compound is practically unknown commercially, and, though the behaviour of the compound under the influence of moisture and carbon dioxide is set forth in the patents we abstract in this issue, there is no mention of the method of manufacture beyond the bare statement that recently a process has been employed which enables the product to be made on the large scale at a paying figure.

According to the latest authorities on solubility, silicon nitride is only soluble in hydrofluoric acid, which practically amounts to being insoluble, but it undoubtedly gives ammonium carbonate when heated in a stream of carbon dioxide and steam, while in the presence of moist air it is slowly decomposed, yielding ammonia. Better still, it is not affected by aqueous alkalies, so that it will practically only be decomposed in the soil by the action of rain charged with carbon dioxide. It can thus be used in conjunction with almost any other fertiliser. An objection may be raised that its efficacy will depend largely upon the season, for it remains to be seen how this new source of nitrogen will act in weather as dry as that we have been experiencing. Whatever the patentee's method of manufacture may be, there is one way which at all events sounds feasible, and that is the fusion of quartz and gas carbon in a blast furnace, which gives an impure product, containing a fair proportion of the nitride. So far the proposal promises well, but much remains to be proved by a practical application in agriculture, the experiments in connection with which cannot fail to be most interesting. We shall expect to be hearing more of this compound in course of time.

#### THE WATER SUPPLY.

The prolongation of the drought is again causing some trouble to those who are not fortunate enough to be in possession of almost limitless supplies, as is the case with Liverpool and Manchester. In the latter city the benefits of the Thirlmere scheme must now be felt and appreciated to the full after the trying experiences of 1887 and one or two subsequent years. The position of those cities, where the constant and plentiful supply of pure water is practically assured, must just now make many other places envious to a degree. It is not unnatural that, under such circumstances, attention should be paid to the necessity of following the example of larger cities on a less extensive scale. The chief difficulty,

however, appears to be the source of supply. To judge by the turn things have recently taken, those who have a plentiful and natural supply of water are beginning to look with disfavour on any efforts to tap the same for the benefit of their less fortunate brethren. Even where the idea is not strenuously opposed a very substantial *quid pro quo* is demanded. It must be admitted, however, that the exaction of the latter is very justifiable even though it does seriously complicate the case of those who are at one and the same time seeking and needing water.

#### MERSEY AND IRWELL JOINT COMMITTEE.

A MEETING of the Mersey and Irwell Joint Committee was held on Monday at the offices, Mosley-street, Manchester, Mr. Alderman J. Thompson presiding. The report of the Chief Inspector (Mr. R. A. Tatton) gave particulars as to the progress made by various local authorities in the provision of works necessary to the purification of rivers and streams in the watershed. Good progress had, it appeared, been made by the Chadderton Urban District Council with their outfall works. At Hollingworth the District Council had commenced the construction of outfall works, which, it was expected, would be completed in a month. At Droylsden the sewage was being treated in the tanks. There had been considerable delay on the part of the Bredbury and Romiley Urban District Council in commencing the construction of outfall works, and the inspector suggested that some action should be taken in the matter. The Hayfield Rural District Council had received tenders for the construction of sewage works, which were about to be let. Serious complaint had been received as to the pollution of the Folly Brook, and inspection had traced the chief cause of pollution to the effluent from the Swinton sewage works. The Swinton and Pendlebury District Council had been communicated with, and a reply had been received stating that the Council were preparing additional land filters, and when those were completed it was hoped that a very satisfactory effluent would be turned into the Folly Brook. With respect to the pollution of the small tributary of the brook, a scheme for removing that had been placed before the Local Government Board some time ago, sanction to which was now expected. The report was adopted. Mr. T. W. Killick, chairman of the Consulting Sub-committee, moved the report of that Committee. The report recommended that extensions of time within which to construct works should be granted to the local authorities of Chadderton, Hollingworth, and Droylsden, and that steps proposed to be taken in the cases of Hayfield, Hyde, and Romiley should be adjourned. The sub-committee recommended that the Clerk be instructed to write and inform the Bury Rural Council that unless more satisfactory progress was made by them before the July meeting of the Joint Committee proceedings would be taken without further notice. The Sub-committee also recommended that letters be written to the following authorities, whose effluents were found to be unsatisfactory, viz.: Altrincham, Moss Side, Little Hulton, Knutsford Urban District Council, Marple, Stockport Rural District Council, and Hale, asking that steps be taken to improve the same. With reference to the bad samples which had been taken from the Swinton and Pendlebury sewage works, the Sub-committee recommended that the clerk be instructed to write and inform the Council that the Joint Committee could not allow any further delay to take place in the reconstruction or alteration of the works, and that failing better progress being made proceedings would be taken against them. Mr. C. Hunter said the present condition of the Mersey, the Irk, and the Medlock was exceptionally bad. He desired to know what was the present state of the Moss Side sewage works?—Mr. Tatton, the inspector, said the works were not finished.—Mr. Hunter: Is it a question of land? Have they not arranged for the land?—Mr. Tatton: No, they have the land, but they have not yet completed the tanks.—The proceedings of the Committee were approved.—Mr. J. Brierley, the chairman, submitted the report of the Chemical Sub-committee, which dealt with the effluent from a number of works and manufactories, and which recommended that in certain cases proceedings should be taken to remedy unsatisfactory conditions existing.—The report was adopted, and the meeting shortly afterwards terminated.

THE WINSFORD WATER SUPPLY.—At the meeting of the Winsford Urban Council on Wednesday, it was resolved that plans should be prepared for constructing a reservoir at a cost of £4,000. At present there is only sufficient storage for one day's consumption, and in the event of an accident to the mains it is felt that the outlook would be very serious. The supply is now limited, owing to the drought and the absence of a reservoir.

## Legal Intelligence.

### CHANCERY OF LANCASHIRE.

(Before Vice-Chancellor Hall, Q.C.)

THE COTTON SPINNING AND MANUFACTURING COMPANY, LIMITED, v. KELSALL AND KEMP, LIMITED.

On, which was heard on Tuesday, is for alleged abstraction of the water of the Naden Brook, near Rochdale, on the which stream both parties carry on business. Mr. Roby, for the defendants, applied that the plaintiffs should be ordered to furnish particulars with respect to their case. Counsel stated that the defendants alleged that the defendants had wrongfully abstracted and discharged foul water, thereby diminishing the flow of water past the plaintiffs, and had also discharged foul water, flocks, and other matter into the brook at a point at which the defendants' outfall upon the stream. The defendants desired further as to the point at which it was said they poured foul water into the brook, and also as to the nature and amount of the damage alleged to have been caused to the plaintiffs' plant and premises.

The defence to the action was an absolute denial of any and a denial of any abstraction, or, alternately, a prescriptive right.

Mr. Roby, for the plaintiffs, said it was absolutely unnecessary to establish what the point of discharge of the foul water was, as they were in possession of their own premises, and knew where they themselves. Formerly the defendants discharged the foul water into the brook, covered shaft or well. That had now been discontinued and the water was discharged into the brook.

Mr. Roby said he thought the defendants should have fair play at the point at which the discharge was said to be made.

Mr. Roby said his clients ought to be allowed to have inspection of the defendants' premises first. They had asked for leave for an order to be made by Mr. Diggle, the Heywood Corporation waterworks, that it had been refused.

Mr. Roby said he did not believe in all this sparring. If it was an honest case why did they not come to trial with it?

Mr. Roby said it was not the plaintiffs who were sparring. Their case was that the defendants had abstracted water and discharged it into the brook.

Mr. Roby said that if this sort of thing went on and the defendants did not come to trial, the Court might have to interfere and send for an order to inspect the place.

Mr. Roby said the works were entirely open to the inspection of the plaintiffs, but not to the inspection of Mr. Diggle, to whom the defendants objected because of his official position.

Mr. Roby, dealing with the application for particulars as to the pollution had caused injury to the plant and machinery, the cost of working the mill, and created an offensive smell, stated that they were dealing with persons who knew all about the nature of this pollution was.

Mr. Roby said the plaintiffs were bound to give the full information as to the case they had to meet at the trial, and were not bound to give their evidence or such particulars as would enable the defendants to so shape their case as to trap the plaintiffs.

The defendants were entitled to fair warning of what the plaintiffs complained about, but not to such particulars as on the face of the case were not directed to the information but the embarrassment of the plaintiffs. The defendants must answer without further delay the queries which had been administered by the plaintiffs, who would be in a better position to furnish fuller particulars. The plaintiffs must complete their inspection of the defendants' works, and the defendants objected on reasonable grounds to the person who had stated, the proper course was to nominate some other person. Within ten days of the interrogatories being answered or the being made, whichever was last, the plaintiffs must give particulars as they could as to the point at which the foul water was to be discharged. He also thought the defendants were entitled to fuller information with respect to the alleged damage. It was clear that the damage might arise in more ways than one: the choking of the machinery, or by acids eating into the machinery.

The defendants must also be furnished with an estimate of the amount of the damage which the plaintiffs considered they had suffered.

Mr. Roby asked for leave to appeal, as the result of the decision was that the defendants would not be able to prepare their case for trial.

Mr. Roby said he should not give leave to appeal. The detail of that character were not proper subjects for appeal. Mr. Roby added that if the inspection did not take place in due

course, the court would take the matter into its own hands and set the action down for trial.

Mr. Roby said he should be very glad for the Court to take that course.

## Our Book Shelf.

A DICTIONARY OF CHEMICAL SOLUBILITIES (INORGANIC). By A. M. Conney. 515 pp., with Appendix. London: Macmillan and Co. 1896. 15s.

Since Storer's scarce and much prized work on solubilities there has been no serious attempt to prepare a similar work, though the want has long been felt, owing to the fact that, excellent as Storer's dictionary was, it bore the date of 1864.

The present dictionary is by no means on the same lines as the old one, being confined to analysed inorganic compounds. In a way this is an advantage, since it is thus possible to render the work fairly concise, thereby facilitating reference.

Strictly speaking, all carbon compounds should be excluded, but we are pleased to see that an exception has been made in the case of carbon monoxide, dioxide, carbon disulphide, and the carbonates, cyanides, and ferrocyanides. In this way the utility of the work to the general run of chemists has been greatly enhanced, as, although a strict classification is desirable, the omission of these compounds would have been a source of trial and disappointment to many.

The work has been brought up to 1894, and though a great deal of old research is reproduced, much wisdom and discretion has been exercised in the selection of the most reliable data. The system of classification adopted and the assortment of type are excellent, but the former should be understood before using the work, and to this end we strongly advise that the fourth paragraph of the preface be carefully read. So doing will save time in the end, and be conducive to the ultimate appreciation of what is one of the most valuable additions to the chemical literature of the last decade. The closer the intimacy, the greater becomes the sense of indebtedness to the author for his conscientious labours.

WATER ANALYSIS. By J. A. Wanklyn and E. T. Chapman. 205 pp. (Tenth Edition). London: Kegan Paul, Trench, Trübner, and Co. 1896. 5s.

New editions of this well-known work have become as familiar as flowers in May, but the advent of the tenth has ample justification, owing to the changes that have been made. These are notably more detailed references to the estimation of the water residues, the substitution of a fresh chapter on the determination of the specific gravity, and a new chapter on table waters. The partial re-writing of the chapter on the albuminoid ammonia process has resulted in a less prejudiced statement of the advantages of the process, which is, nevertheless, even more convincing owing to its increased impartiality.

There are still a few literary errors in the text that even the revision of the tenth edition has failed to eliminate, but the many important additions and working wrinkles condone such an oversight, even in so late an edition of this now generally recognised authority on the analysis of waters.

HANDBOOK FOR THE BIO-CHEMICAL LABORATORY. By J. A. Mandel. 101 pp. London: Chapman and Hall, Ltd. 1896. 6s. 6d.

There are many unique points about this little handbook that will recommend it to all workers in bio-chemical laboratories.

It is divided into two sections, the first giving about sixty or more practical methods of preparing the most important substances that enter into the composition of the fluids and tissues of the animal body.

In the second part over two hundred tests are described. These are arranged in alphabetical order, the tests being designated by the names of the originators. In this way reference to any one test is but the work of a moment, while the addition of a contents table of the preceding preparations equally facilitates reference in this section also.

In short, a modest, but thoroughly practical and useful work, which is neatly and judiciously got up.

THE OLD LIGHT AND THE NEW. By William Ackroyd. 102 p.p. illustrated. London: Chapman and Hall, Ltd. 1896. 1s. 6d. net.

This brochure is a popular, but scientific account of the origin and nature of the new rays recently discovered by Prof. Röntgen.

As such it is as successful as can be expected with so difficult a subject, which does not lend itself at all freely to popularisation. A considerable part of the brochure is taken up with a lecture on the chemistry of colour, read by the author, late last year, and which is full of suggestion and interest.

THE LIQUEFACTION OF GASES. By M. Faraday. (1823-1845.) 79 pp. Edinburgh: W. F. Clay. 1896. 2s. nett.

This, the twelfth of the series of Alembic Club reprints, comes at an opportune moment, as the subject with which it deals has lately become prominently interesting, owing to the work that is being done by Prof. Dewar and others.

There is always something fascinating about the accounts of Faraday's work, and this fact renders this reprint of his work on this subject one of the most interesting of the series, especially as the papers of Mr. Northmore, to which reference is frequently made, are added in the form of an appendix.

DIE FORTPLANZUNGS-GESCHWINDIGKEIT DER SCHWERKRAFT-STRAHLEN. 92 pp., illustrated. LICHT-ELEKTRICITÄTS-UND X-STRAHLEN. 54 pp. Both by R. Mewes. Berlin: M. Krayn. 1896. 2 marks and 1.50 m. each.

The former of these pamphlets is an able contribution to the subject of gravitation, dealing mainly with the rate of the transmission of the force and the theory of its action.

The latter is one of the most highly scientific and valuable of the contributions that have been made to the theories bearing on the origin of the Röntgen rays. As such it has aroused so much interest in the scientific world that a second edition has already been called for.

METALLIC STRUCTURES: CORROSION AND FOULING, AND THEIR PREVENTION. By J. Newman. 374 pp. London: E. and F. N. Spon. 1896.

The work is divided into two parts, the first of which treats on the preservation of iron and steel structures, the chapters on rapid corrosion and the corrosive action of soils, &c., being particularly useful. The other main features are the chapters on the comparative corrosibility of steel and cast iron, galvanic action in relation to corrosion, and special references to the corrosion of the various parts and specific forms of metallic structures.

Part II. refers more particularly to the prevention of fouling and corrosion in structures submerged in sea and fresh water. The chapters on the paints, oils, and varnishes used for the purposes of protection are noteworthy, while the concluding chapters on painting specifications and scamping tricks are especially useful. There is apparently no reference to the Barff-Bower process, but there is an excellent chapter in part I. on the influence of the scale of cast iron and steel. The book is practically confined to the treatment of metallic building structures and the use and preparation of preservative paints and compositions.

Within its sphere it is, however, an excellent book, being a thoroughly practical collection of aids and helpful information, in which an elaborate consideration of the corroding agencies is carefully avoided, since such information can be found at length in reliable works on chemistry, thus leaving more room for recording particulars of all the most important tests and results that bear on the prevention of corrosion. A knowledge of the corroding agencies is necessary, but the prevention of the corrosion itself is more to the point.

### A FIBROUS FILLING FOR PAPER.

A USEFUL material for filling paper has recently been introduced under the name of "Nematolith." Owing to its fibrous nature it promises to prove of great utility as a filler, as in this particular it possesses a very decisive advantage over the run of materials used for this purpose.

The new substance is, chemically speaking, a member of the asbestos family, but it has an advantage over the latter owing to its freedom from the iron, lime, and sulphur compounds that are usually found in crude mineral asbestos, the raw material from which Nematolith is specially prepared for paper-making purposes testing on analysis 96% of pure silicate of magnesia. Owing to its exceptional whiteness and purity, Nematolith stands far and away in advance of all the other mineral fillings that have been hitherto introduced. It improves the white tone of the paper in a really remarkable manner, and is therefore as useful in the preparation of the finest papers as well as those of inferior quality. It is also economical, as by its use the appearance of an indifferent paper can be materially improved by the addition of a comparatively small quantity of filling. Above all, in cases where unsuitable or impure water has to be contended with in the manufacture, this new filling will prove of great service.

Owing to its fibrous nature, Nematolith is readily retained by the pulp, which is proved by the fact that on incinerating the paper when finished as much as 95% of the material added is found in the finished sheet. It is also permanent, since it is unattacked by either

acids or alkalies, and is even unaffected by sulphurous acid, both of which points afford additional testimony to its economy.

The determination of the ash has shown that even when employing as much as 20% practically the whole is retained in the finished sheet. This property gives it a great pull over china clay, or blanc fixe, etc., with which 50% and even 60% is lost during the process of manufacture, and this quality must be taken into consideration when comparing it in price with the other materials usually used for filling purposes.

The above claims are substantiated by the fact that the specific gravity is very low. Furthermore, while a small addition suffices to effect the desired improvement in the whiteness, if a large proportion is employed the paper does not lose in body or touch.

This substance has been the subject of a number of experiments and investigations, all of which have given satisfactory results, and at the same time have brought out the following points:—When employed in large proportions even it requires no sizing, and a perfect filling with the fibre is obtained. A paper containing up to 20% of this filling does not scratch under the pen, and so cause the ink to run and blot. Being of a soapy nature to the touch, it is very valuable in hot pressing or callendering, enabling a very highly glazed surface to be produced. It can be introduced into the beater in the crude state, provided that it is beaten long enough to ensure a uniform mixture with the pulp. It is, however, in all cases preferable to use a separate preparation kettle. Thus the best method of using it, and one that is largely adopted by several paper-makers, is to boil a 100 kilos of Nematolith with 1,000 litres of water (about 220 lbs. in 220 gallons of water), and then add a quantity of starch so as to more perfectly fix the filling. The addition of the starch is not, however, absolutely necessary. The whole need not be filtered, as the Nematolith is entirely free from all impurities.

It is introduced after the paper has been sized. A number of paper-makers in Belgium, France, Holland, Germany, and Austria have been using this new filler with most satisfactory results.

### EXPORTS OF ALKALI AND BLEACH.

THE following returns, which are taken from the official foreign and colonial statistics of the United Kingdom, give the amount and value of alkali and bleaching materials shipped to the undermentioned countries for month ending April, 1896, as compared with 1895:—

| Port.                    | 1895.   | 1896.   | 1895.   | 1896.   |

| Other countries ..... | 38,698  | 34,674 | 14,338 | 12,062 |
| Total .....           | 114,718 | 93,619 | 42,186 | 31,974 |

THE SAFEST AND MOST DANGEROUS ILLUMINANTS.—Insurance companies have made up their minds that electric lighting, when the wiring is well done (and they have formulated special rules on the subject), is the safest of all illuminants. Statistics show the following comparative risks: Fires in one year from paraffin and kerosene, 259; from gas, 110; matches used for gas, 35; candles, 88; arc electric lights, seven; and incandescent electric lights, only one.

END OF THE DARLINGTON STEEL WORKS.—The decision to wind up the Darlington Steel and Iron Works will remove another of the rolling mills from Darlington. Blast furnaces and several rolling mills that twenty years ago were productive there have been dismantled. The large locomotive works give alternative employment, but the removal of the works that have been hinted at is proof that the Skarnside town feels the competition keenly in the metallurgical trade.

## The Patent List.

*This list is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of E. Davis and Alfred R. Davis, who report professionally the value of Chemical Patents.*

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

**Improvements in Drums for the Transport of Petroleum, etc.** D. Caird The Iron and Steel Plant Co., Ltd. 10,646. May 18.  
**Preparation of Soaps.** J. Ascough. 10,681. May 18.  
**Preparation of Manures.** F. W. Saatmann. 10,715. May 18.  
**Lead Electrodes for Accumulators.** H. O. Tudor. 10,718. May 18.  
**Improvements in Filters.** T. Linke. 10,805. May 19.  
**Improvements for Secondary Batteries.** 10,811. May 19.  
**Preparation of Glycerine and Caustic Soda from Soap Lyes.** J. Glatz and J. G. Chamberlain. 10,837. May 19.  
**Preparation of Specifically Heavy Ammonia Soda.** J. Y. Johnson. 10,842. May 19.  
**Improvements in Metallic Surfaces against Chemical and Atmospheric Action.** H. H. H. 10,864. May 19.  
**Preparation of White Lead, etc.** T. H. Cobley. 10,890. May 21.  
**Preparation of Washing Flannel, etc.** C. Drummond. 10,955. May 21.  
**Preparation of Purifying Feed Water.** J. G. Chamberlain. 10,983. May 21.  
**Preparation of Acid from Argols.** H. Rasch. 11,075. May 21.  
**Improvements in Filter.** J. A. Orme. 11,080. May 21.  
**Improvements in Solid Disinfectant.** W. S. Daff. 11,103. May 21.  
**Improvements in Traps.** J. C. R. Oke and A. Stubbs. May 21.  
**Preparation of Clarifying Fats.** A. Beveridge and J. Pursell. 11,112. May 21.  
**Preparation of Pure Alumina, Sulphate of Aluminium and Silica from Clays.** Payne. 11,160. May 22.  
**Improvements in Chemical Apparatus.** C. Dawson. 11,216. May 22.  
**Preparation of Sewage, etc.** E. W. T. Jones and J. Garfield. 11,242. May 23.  
**Preparation of Cyanides.** E. A. Williams and J. F. C. Williams. 11,326. May 23.  
**Preparation of White Lead.** Dr. Urquhart and J. M. Small. 11,328. May 23.  
**Improvements in Electrodes for Electrolytic Purposes.** E. A. G. Street. 11,338. May 23.

### EXTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal, and the RIGHTS of publication are RESERVED. This is the earliest issue in which abstracts of Chemical and allied patents accessible to the public.*

**Improvements in Apparatus for the Disinfection of Sewage.** P. O'Dowd. Eng. Pat. 3,877. May 4, 1895.  
A intercepting chamber is placed between the house drain and the sewer. This chamber is of rectangular shape, and may be constructed of sheet iron, or, for large systems, in masonry or brickwork. It is divided into compartments by two screens of fine wire netting, on sheet of canvas is laid. The first is placed a short distance from the inlet of the chamber so as to form an annular space in which the sewage collects. The second is situated half-way between the inlet and the outlet at the top. On the second screen a layer of peat is placed, and the rest of the space filled up with peat charcoal. The lower compartment is filled with peat charcoal only. In the upper compartment the sewage is precipitated, as it passes through the upper screen, and is precipitated in the second, and passes away without carrying with it precipitating agents. To facilitate the removal of the solid precipitate from the sewage, the screens are made detachable, simplifying the processes of cleaning and re-charging. There is no loss of sewage.

**Improvements in Fertilizing by the Aid of Artificial Nitrogenous Compounds.** H. Mehner, Savigny Platz 5, Charlottenburg, Germany. Eng. Pat. 2,700. June 27, 1895.

It is taken of the fact that silicon nitride is decomposed by moisture and weak acids to form ammonia. The chief advantages claimed are the insolubility, which prevents loss, and the ease of carriage as compared with the other forms of nitrogenous compounds. It can be used in conjunction with other fertilizers that do not contain ammonia.

**Improved Process for the Separation of Silicic Acid from Siliceous Substances.** F. Brünjes, Langelsheim, am Harz, Germany. Eng. Pat. 6,157. March 19, 1896.

Commercial attempts at decomposing clays with the waste acid from the tar or oil industries have not been successful, on account of the nauseous smell imparted to the resulting sulphate of

alumina even when heated to below 100°C. In this process the patentee decomposes argillaceous substances with vitriol in conjunction with added organic bodies, such as molasses, sugar, starch flour, etc., using from 0.1% to 0.5% for every 1% of silicic acid to be set free. The organic substances are first heated to about 90°C. with vitriol, and then added to the argillaceous substance. The product forms itself into coke-like cakes, from which the sulphate of aluminium can be easily washed out. The advantages claimed are threefold. Firstly, that colouring and badly smelling products are not formed; secondly, that the gelatinous and soluble silicic acid is easily converted into the granular and insoluble modification; and, lastly, that the sulphate of alumina when once formed is not reduced by the action of the organic compounds formed at the temperature necessary for the conversion of the silicic acid.

**Improvements in or Relating to the Manufacture of Salt.** F. P. Gutierrez, of Cabezon de la Sal, Santander, Spain. Eng. Pat. 1,729. January 24, 1896.

The object is to utilise the waste heat from furnaces in which melted or moulded salt is prepared in blocks for feeding purposes. To this end the waste heat is utilised for the evaporation of brine in suitable boilers. The residual heat can also be employed for drying the salt obtained from the evaporating boilers. An advantage attendant upon the fusion process is that the more impure qualities of rock salt as obtained from the mines can be used, the resulting product being free from impurities and quite suitable for use by animals.

## THE NAPLES SOAP TRADE.

THE speciality known as Naples soap is the subject of a section in the last British Consular report from that place. Its distinctive title is due to the fact that its main ingredient is olive oil. Ordinary olive oil is made by submitting the berries of the tree to a very high pressure and squeezing the oil out of them, but when this has been done to the utmost there remains a large mass composed of pulp and the stones of the fruit, which still contains a considerable percentage of oleaginous matter. This mass of pulp and stones is valueless in itself, and until a means had been discovered to extract the residuum of oil from it it was to all intents and purposes a waste product. The stones, it is true, were ground to a fine powder and used in the adulteration of pepper, but otherwise the mass was commercially of small value. Owing to the extent to which the olive tree is cultivated in Southern Italy, and the large quantity of oil manufactured and exported, there are few districts more favourable for collecting the refuse from the presses which forms the basis of Naples soap. Many experiments have been made from time to time by Richardson Irvine and others, who employed volatile hydrocarbons for the purpose of extracting the remaining oil from the refuse; but their processes failed, in some cases from the disagreeable smell of their products, and in others from the want of efficacy of their inventions. The best and most perfect means known was invented by Deiss, a chemist of French or Swiss origin, who by means of a strong ley of solvents, of which bi-sulphide of carbon is a prominent ingredient, extracts a greenish coloured oil from the refuse at a small cost, and of sufficient purity to form the basis of the best soaps. Messrs. Genevois et Fils are, perhaps, the most important Neapolitan house in the trade. Of industrial soaps their "Abeille 62" is very largely exported to England. It has the appearance of green and white marble, and contains 62% of olive oil, every batch being chemically tested before exportation. It is used for wool-washing, the cleansing and preparation of silks and stuffs, and also in connection with ironwork, steel, and wire-drawing. "The industrial branch of the business is far the most important and the works are being extended accordingly, as the exports amount to several hundred tons annually, and increase year by year; but the manufacture of toilet soaps is not neglected. A soap which used to be known as 'Almond shaving cream' is still largely exported to America; but, though no soap produced a finer lather, it has been beaten out of the field in England by the more portable and convenient products of our own soapmakers, who will perhaps secure the American market some day as completely as they have conquered the British market now. In cake soaps the Naples manufacturers still obtain a large amount of British patronage, and it is amusing to note that the tablets sent to Great Britain are marked 'Naples soap,' while the same soap for the local market is marked 'Elegant soap' to give it a British flavour for the Neapolitan public. Ever since the use of glycerine in the manufacture of explosives and for other commercial purposes raised its price it has fallen into disuse here, and an inferior toilet soap with sugar for its basis has only partially taken its place."

**AGRICULTURAL ECONOMICS.**—Sir Walter Gilbey, president of the Royal Agricultural Society, has offered to found at Cambridge a lectureship in the history and economics of agriculture.

## Reports of Companies.

### MESSRS. G. KYNOCH AND CO., LTD.

The directors, in their report for the year ended April 2, state that the accounts show a net profit amounting to £29,111.; to this has to be added £12,510., the amount brought forward from last year, making a sum of £41,622. The directors' fees will absorb £2,000., and the directors recommend that out of the remainder a dividend at the rate of 10 per cent. per annum, amounting to £16,000., be paid on the preference shares, and a dividend at the rate of 13 per cent. per annum, amounting to £5,200., be paid on the ordinary shares, and the balance, £18,422, carried forward. The Lion works at Witton, and the rolling mills at Lodge-road have been fully employed during the past year. The directors have taken advantage of a prosperous year to repair or replace a large proportion of the engines and machinery. The black powder mills at Worsboro' Dale have been continuously employed day and night at remunerative prices. The Arklow nitro-explosive Works have been completed, and the output raised to nearly double the contemplated amount. The Government is being supplied to the full extent of its requirements, and orders from the private trade are coming in satisfactorily. An explosion in one of the gun-cotton drying houses occurred in October last year. The damage to property was not material, but one life was unfortunately lost. The cause of the explosion has never been determined, and the directors can only say that Her Majesty's Inspector entirely exonerated the company from all responsibility and blame. The explosion, however, had the effect of stopping the company's output of cordite, and of interfering with its business in high explosives for some little time, and the directors have, consequently, found it advisable to make a portion of these explosives in England. In addition to the manufacture of cordite, the company is now making at Arklow dynamite, gelignite, and other blasting compounds. Arrangements have been made with selling agents in various places, and the directors anticipate, for the coming year, a fair contribution to the profits of the company from this source. The manufacture of nitric acid and of acetone is also carried on at Arklow. A steamer has been bought to carry the company's goods, and the purchase of a second is in contemplation. It is the intention of the directors to distribute, in December of the present year, an interim dividend of 3½ per cent. on both preference and ordinary shares. The distinction between these shares will then cease, and all the share capital will have equal rights and become of equal value. The time must shortly come when the constant and extensive developments of the company's business, which have been in progress for the last seven years, and which are still continuing, will require larger cash resources; the directors are not at present prepared to make these recommendations, but wish the shareholders to understand the position, and to know that the condition of the business already justifies, and will soon demand, an important increase and re-arrangement of the company's capital.

### SAN SEBASTIAN NITRATE COMPANY, LIMITED.

The seventh annual general meeting was held last week at Winchester House. Mr. A. R. Robertson presided, and, in moving the adoption of the report, expressed regret at the unsatisfactory results of the past year's working. Owing to the over-production and consequent low prices the nitrate industry had been passing through a period of depression, but the recent completion of the nitrate combination had placed things on a better footing. For the next three years, beginning on April 1 last, the production would be regulated so as not to exceed the consumption. Last year the total production of nitrate was 1,210,000 tons, and the consumption slightly over 1,000,000 tons, leaving a surplus of 200,000 tons. Since the combination had been in force prices had improved to between 5s. 7d. and 5s. 9d. per quintal on the coast, with every chance of going higher. The March shipments had been very large, and had therefore interfered with the further advance which had been expected. Last year they made only 9,000 tons of nitrate. They could have produced more, but, in view of the unremunerative prices obtainable, they did not work full time. So far the trial to determine what their output should be for the next three years had resulted satisfactorily, and he believed it would be found that they would be entitled to produce from 11,000 to 12,000 tons per annum. A considerable sum of money had had to be expended on their plant and machinery, and, contrary to the wish of the board, who desired to spread the cost over three years, the auditors had insisted on its being charged to the past year's revenue. Already during the current year they had made some very satisfactory sales. The board were not proposing to declare a dividend on the present occasion, but so soon as they received certain remittances from the coast, and moneys due to them for iodine, they hoped to be able to do so. He thought it would not be necessary to keep the shareholders waiting for an interim dividend longer than next month. They had liquid assets of between

£16,000. and £17,000, whereas they only owed about £4,000. In conclusion he expressed his belief that, judging by the way they started the new year, their next balance-sheet would be very different from that now submitted. Mr. G. M. Inglis seconded the motion which was unanimously adopted.

*Pascha and Jaspampa Nitrate Company, Limited.*—The report made up to December 31 shows a loss of £27,298, and, after deducting the amount of £11,981. carried forward as undivided profit from the previous year, a balance of £15,317. remains to the debit of profit and loss account.

*Mason and Barry, Limited.*—At an extraordinary general meeting held last week, at the offices, Cannon-street, Mr. Francis Ricardo presiding, the resolution passed at the meeting on the 11th ult. was confirmed, on the motion of the chairman. The resolution was for reducing the capital of the company from £840,000. in shares of £4 each to £630,000. in shares of £3. each, the reduction to be effected by turning £1. a share to the shareholders.

## THE TUSCAN OLIVE OIL INDUSTRY.

THE United States Consul at Leghorn, in a recent report on olive tree and olive oil of Tuscany, says that the tree forms one of the chief agricultural resources of the province, about 270,000 acres being devoted to its cultivation, while the yield is about 6½ million gallons of oil. When obtained from sound, well-matured fruit, with proper skill and attention given to its extraction, the oil reaches the highest standard of excellence, and cannot be surpassed by the oil of any other country. It is generally known abroad as Lucca oil, the finest quality is produced in other Tuscan districts as well, such as Calci and Buti, in Pisa. The olive groves which clothe the hills extending from Pisa to Viareggio, on the Genoa-Pisa line, and from Pisa to Pontedera, on the Leghorn-Florence line, are famed for the oil they produce. The qualities of delicate flavour, fine light golden colour, medium density, and keeping long depend on the soil, topographical position of the groves, the climate, and the species of the plants. The slopes of hills, with a suitable exposure, and a rocky calcareous subsoil are the best for the production of the finest oil, though in other situations the tree may vegetate more luxuriantly. The Razzo olive tree is the best of all others for oil-producing, and is favoured in Lucca and Pisa. The best oil is made in the first months of the year. The tree attains to a great age; it may bear some hundreds of years, but the average life of the cultivated tree is thought to be from 100 to 150 years. The fruit is all hand-picked. Many favourable conditions are required to combine for the production of the best quality of Tuscan oil that it is necessarily restricted in amount, and always commands a good price. Much of what is sold as Lucca oil is, at best, a mixture of inferior Tuscan oil with the cheaper and more inferior production of Bari, in South-Eastern Italy. Much Bari oil is taken yearly to Leghorn, Lucca, and other markets in Tuscany and re-exported as Lucca oil. The Consul explains that oil may be pure, in the sense of being wholly free from adulteration, yet be rank, nauseous to the taste, and even ill-smelling. Purity alone is not enough; fine quality also is needed. There is also much adulteration of olive oil with seed oil, especially the oil of the cotton seed, which is the cheapest of all. Such oil is as far removed from fine Lucca as is cream from rank tallow. Italy alone produces 90 millions of gallons of olive oil, while the Tuscan production, as has been said, is less than seven millions. "But consumers may rest satisfied that brands of Lucca oil guaranteed by responsible and reputable firms in the trade in Tuscany are absolutely pure olive oil."

**CIRCLING THE GLOBE IN FIFTY MINUTES.**—At the recent New York Electrical Exhibition a telegraphic message was sent round the world in fifty minutes. Mr. Chauncery Depew wrote a despatch as follows:—"God created Nature's treasures, and science utilises electric power for the grandeur of the nations and the peace of the world. This was sent by President Chandler, of the Postal Telegraphs Department, who was sitting at one side of a table in the exhibition, opposite him, at the other side of the table, was Mr. Edison, waiting to receive it after its long journey. Mr. Chandler transmitted it 8.34 over the wires of the Western Union, through Chicago, Los Angeles, San Francisco, and there to Vancouver, Winnipeg, Montreal, and London, which it reached at 8.38. Thence it was sent through Lisbon, Gibraltar, Malta, Alexandria, Suez, Bombay, Madras, Singapore, Shanghai, Nagasaki, and Tokio. The message was returned by the same route, and was received by Mr. Edison in 9.1 minutes after Mr. Chandler had started it. The message was reported from each of the places mentioned as it reached it. This is the fastest piece of international telegraphing ever accomplished. The message cost at tariff rates over £30."

## ARGON AND HELIUM AMONG THE ELEMENTS.

ESSOR W. RAMSAY delivered the fifth Boyle lecture before the Oxford Junior Scientific Club on Tuesday, his subject "The Position of Argon and Helium among the Elements." Discovery of argon and of helium, like the discovery of carbon of oxygen, and of nitrogen, has brought new problems before the scientific world. To afford an idea of the necessary change of our atmosphere and the influence of Boyle, Mayow, Hayles, Rutherford, Priestley, Scheele, and Cavendish in modifying and of these primitive notions of the ancients. Portraits of these men were thrown upon the screen. The influence of Lavoisier alone was touched on, and the overthrow of the phlogistic which predicated that combustible substances when burned lost their principle named phlogiston, instead of gaining oxygen, led to. Passing on to the more immediate subject of his lecture Ramsay shortly described the discovery of argon by Lord Rayleigh and himself, and of helium, accidentally lit on during a search for a clue to guide him in attempting to form a compound of this element, which up to now had been recognised only by the presence of a yellow line in the spectrum of the solar spectrum, now appeared for the first time as a terrestrial substance. Owing to the non-activity and resistance to combination of the newly discovered elements, the usual method of determining their weights was not available. Hence purely physical methods were resorted to. The density of a gas compared with that of hydrogen, the lightest of all known elements, expressed its molecular weight compared with that of a molecule of hydrogen; and as a molecule of hydrogen was supposed on substantial grounds to consist of two atoms, the density was half the molecular weight, as was usual, with the atomic weight of hydrogen. Not all gases, however, possessed molecules consisting of two atoms; those which possessed monatomic molecules were mercury, and those borne out not merely by considerations connected with the nature of its compounds, but also by the ratio between the heats of heat required to raise its temperature when it was kept constant, on the one hand, or, on the other, when it was kept constant. Heat, according to the modern conception, is converted into work, and was therefore termed a form of energy, and the heat communicated to mercury gas, provided it was allowed to expand, was utilised solely in moving its molecules into space; while with other gases some of the communicated heat was employed in causing the atoms to move in some unknown way in relation to each other within each molecule. Both argon and helium showed the same peculiarity and behaviour, and it was legitimate to conclude, for the same reason, that in their case, too, molecule and atom were identical. Hence the densities of helium and of argon must be in the ratio of their atomic weights, inasmuch as atomic and molecular weights were the same. This gave for the atomic weights of these elements the values for helium 4.28, and for argon 39.88. The elements in the order of their atomic weights fell into periods, as shown by John Newlands some thirty years ago. The atomic weight of argon, however, was almost precisely that of calcium, and it was to find two elements, and beyond experience to find two such elements, with the same atomic weight. It was therefore necessary to seek for some hypothesis which would remove the difficulty. That argon was not wholly composed of monatomic molecules, as, indeed, among a great majority of monatomic, a few diatomic molecules. Although this supposition had not yet been absolutely proved it appeared to be highly improbable. Another supposition was that argon and helium were mixtures of two or more elements with each other. This idea has lately been put to the proof and negatived. There is no argon lighter or heavier than 19.94 times the weight of hydrogen. In conclusion, the lecturer alluded shortly to some of the remarkable properties of these elements, notably their change of refractive index with change in electric intensity, the great refractivity of argon and its extraordinary conductivity for electricity, and lastly, he pointed out that, contrary to all precedent, it diffused more rapidly than any other gas deduced from its density. He predicted that such anomalous properties would lead to radical changes in our views concerning the structure of gaseous matter.

AT THE MANCHESTER TECHNICAL SCHOOL.—About four o'clock on Wednesday morning a fire was found to have broken out at the Manchester Technical School in Princess-street. A policeman gave information at the chief fire station, and a detachment of fire engine arrived under Mr. Savage quickly turned out. It was seen that the fire was confined to an office on the ground floor, and a portion of the building in the laboratory in the basement. The fire was extinguished before much damage could be done. The outbreak was due to a gas flame being placed too near to timber.

## Trade Notes.

**FAILURE IN THE SUGAR TRADE.**—In the beet sugar trade the suspension is announced of the firm of Musmann and Barrett, which was established in 1887. The liabilities are estimated at about £30,000, of which about one-half will fall upon London houses.

**NITRATE STATISTICS.**—The Permanent Nitrate Committee's public statistical circular for June shows:—Total exports to Europe, May, quintals 1,132,000; loading for Europe, 1st June, quintals 1,480,000; imports, Europe, May, 71,050 tons; deliveries, Europe, May, 67,350 tons; visible supply, Europe, 1st June, stocks and afloat, 372,120 tons.

**STEEL BARRELS FOR TRANSPORTING VITRIOL.**—Messrs. The Iron and Steel Plant Co., Ltd., advise us that they have just completed an order for over two hundred and fifty steel barrels for the Andrée Polar Expedition. These are to be used for the transportation of the sulphuric acid with which it is intended to manufacture the gas for Captain Andrée's balloon. Having given considerable attention to this idea and made various experiments, they are satisfied that the special steel barrels which they have manufactured will prove eminently suitable for the carriage of sulphuric acid.

**LOSS OF A LIVERPOOL NITRATE SHIP.**—On Saturday last information reached Liverpool of the abandonment of the Liverpool ship *Gitana*, but it is fortunately mentioned that all her crew have been saved. The *Gitana* left Iquique, South America, on the 2nd of March last for Hamburg with a cargo of nitrate, and a telegram received from Durban reported the landing of the crew there by the ship *Edinburghshire*. The *Gitana* seems to have met with very heavy weather, as the cablegram says she was dismasted when abandoned by her crew. All on board were saved, but the date of the abandonment is not stated. The *Gitana* belonged to Messrs. R. W. Leyland and Co., of Liverpool, and was an iron ship of 1,401 tons, having been built as far back as 1861. She was under the command of Captain Roberts.

**EFFECTIVE MILK ADULTERATION FINES.**—Before Mr. J. M. Yates, Q.C., at the Manchester County Police Court, the other day, George Heald, farmer, of Didsbury, was summoned for selling adulterated milk. Inspector Pattinson stated that on the 30th ult. he met the defendant's cart, and asked to be supplied with a pint of new milk. The man replied that he had no new milk, it was the previous day's. The inspector said he must have a pint, and was supplied, and paid the man 1d. for it. A sample was sent to the analyst, who certified that five per cent. of water had been added to every hundred parts of the poorest milk. On behalf of the defendant it was contended that the milk contained a fair amount of fat. Mr. Yates said it was a clear case, and seeing that the defendant had been previously fined £2. and costs, £10. and costs, £5. and costs (for refusing to sell a sample), and £10. and costs, he must again pay £10. and costs.

**COMPENSATION FOR BRINE PUMPING.**—The Local Government Board have just issued an order providing for the formation of a Compensation Board to carry out the provisions of the Brine Pumping Act, which recently received the Royal Assent, and under which salt and alkali makers in the Northwich district are to contribute up to 3d. per thousand gallons of brine pumped for damage occasioned by the subsidence of property. The order sets forth that the Board, which is to be elected in November, is to consist of nine members, of whom three are appointed by the Cheshire County Council, two by the Northwich Urban Council, and one by the Northwich Rural Council, and three elected by the brine pumpers. The chairman of the County Council will act as returning officer at the election, at which brine-pumpers vote for candidates on the basis of one vote for every 10,000,000 gallons of brine pumped in the year preceding. The Board retains office for three years.

**FATALITY AT A CHEMICAL WORKS.**—A man named Joel Hardley, about 30 years of age, died at the Victoria Infirmary, Northwich, on Tuesday morning from the effects of the scalds sustained while trespassing in the chemical works at Bonner's Green, near Northwich, on Sunday night. Hardley was formerly employed at these works, and had been discharged some weeks previously. It appears that he came into the works at 11 p.m., under the influence of drink, and having sat down in the hut provided for the workmen, seems to have gone straight to the sump from which the still liquor is pumped to the overhead tanks. By some means his legs became entangled between the planks covering the sump, which held him there until released by the still-man. A still of neutral liquor was being run off at the time, and there was a lamp placed within twelve inches of where he fell, but his condition did not seem to enable him to recognise it. As the consequence the still liquor, at a temperature of about 180° F., poured over him until the still-man came to his assistance, probably only for a few minutes, but sufficiently long to produce consequences which terminated fatally on Tuesday morning as stated. Joel Hardley was formerly in business as a successful butcher in Northwich.

**ASBESTOS AND MICA IN WESTRALIA.**—The asbestos recently found at Goongarrie has been pronounced to be of good quality, and efforts are to be made to introduce it on the London market. A discovery of mica has been made between Coolgardie and Londonderry. The sheets are said to be of considerable size.

**WORKS STRUCK BY LIGHTNING.**—About a quarter past six on Wednesday evening the chimney of Mr. Ellis Salt's Works, Liversedge, was struck by the electric fluid, a violent storm passing over the district at the time. The masonry at the top and the brickwork for seven or eight yards were destroyed. The damage is estimated at about £100, and the property was not insured.

**IMPROVED RONTGEN TUBES.**—The General Electrical Association announce that they have succeeded in so improving the Röntgen tubes as to render it possible for the internal structure of the head, the larynx, and more especially the action of the respiratory organs and heart to be observed direct on the fluorescent screen. A practical demonstration is to be given at the Surgical Congress in Berlin.

**THE RESIN MARKET.**—In their monthly report on the resin market Messrs. F. and S. Chiesman and Co., of London and Liverpool, say that the first month of the statistical year in resin, as compared with last year, shows a falling off in the receipts of common resin and a slight increase in those of pales. Exports from Savannah and other ports have been very heavy, and stocks are considerably reduced. Business in the London market has been quiet on the spot, with a fairly good trade for "forward" shipment. The market has continued steady in Liverpool, with, however, only a limited demand either on the spot or for shipment. The cheap steamer lots lately brought have kept consumers fairly well supplied.

**BRASSWORKER'S DISEASES.**—A report has been issued this week from the Departmental Committee on the conditions of labour in the manufacture of brass and of kindred amalgamations. The larger share of the attention of the Committee, it appears, was devoted to studying the conditions of work in Birmingham as being the chief seat of the manufacture of brass, but the inquiry was extended to Willenhall, Wolverhampton, Edinburgh, Glasgow, Sheffield, and other places. The Committee during their inquiry met with ample evidence that brassworkers as a class were extensively liable to diseases of the respiratory organs, such as bronchitis, asthma, and even phthisis.

**THE SHIP CANAL AND THE OIL TRADE.**—Oil has become one of the most important of the direct imports from New York. Special storage facilities at the docks are offered by the Canal Company, and it is understood that some of the largest importers are now selling American lubricating oils, imported *via* the canal, at the same prices for delivery ex store Manchester as are current for the same qualities ex store Liverpool. This means a saving to local buyers of nearly ten shillings per ton. A certain amount of petroleum oil in cases has also been imported, but until large petroleum storage tanks into which tank steamers can discharge are erected on the banks of the canal, Manchester will be at a disadvantage in competing for this trade against ports where such provision exists.

**THE TREATMENT OF RHEA FIBRE.**—In the House of Commons, on Thursday, Sir J. Leese asked the Secretary of State for India whether his attention has been called to the recent discovery of Professor Bilderbeck Gomess of an alleged method of treating rhea fibre on an economical and effective basis. And having regard to the great importance of such a discovery in connection with both the agricultural and manufacturing industries of India and the home textile manufactures, if he would cause inquiries to be made with the object of developing the production of this fibre.—In reply, Lord G. Hamilton said: My attention has not been called to the process mentioned in the question, but if it has a commercial value I have no doubt it will receive the attention of those who are specially interested in the subject. As at present advised, I see no ground for any official inquiry.

**SCIENTIFIC GOLD MINING.**—At the annual meeting of the Institute of Mining Engineers held this week the President (Mr. Mitchell) said:—One notable feature of the gold mining of the present day, especially in South Africa, was the establishment of the industry on a scientific basis. The very best engineering and chemical knowledge had been devoted to devising economies in the production and treatment of ores and to the invention of processes whereby the largest possible amount of gold might be extracted from the ore. One invention, that of the cyanide process (M<sup>r</sup> Arthur-Forrest patent), had revolutionised gold mining in South Africa and New Zealand, and was exerting a great influence in the treatment of ores elsewhere. Generally, it might be said that gold mines were much more efficiently managed than formerly, and as a result it was likely that for many years to come the world's output of gold would be very largely in excess of what it had been in the past.

**THE POSITION OF AMMONIA.**—The following recently appeared in the commercial columns of the *Glasgow Herald*:—"The position of ammonia (writes a correspondent), an important lesser Scotch industry, is slowly forcing itself to the front. The sliding-scale introduced into the bye-products contracts of the gas-works bears weightily on the iron producers of the article, who have to contend with large oncost of the recovery plant. With sulphate of ammonia selling at £7. 15s. per ton in bags f.o.b., an enormous shrinkage has taken place; and it must soon become for them a question if the ammonia is worth the cost of recovery in the shape of sulphate. Deducting bags, carriage, dues, weighing, brokers' commission, and the cost of sulphuric acid—which few iron companies manufacture—the net and naked price cannot exceed £5. per ton, not charging oncost or labour or management; so that the iron recoverers are heavily handicapped compared with those manufacturers who get the bye-products ready to hand on sliding-scale, and who generally imprison the ammonia in acids of their own manufacture. It is a well-known fact that none of the famous natural guanos of Ichaboe or Peru or Chili contain their ammoniacal salts in the shape of sulphate. All the finest virgin guanos were found to contain the salts of ammonia in the shape of the subtle and little understood anhydrous carbonate, or the hydrated sesquicarbonate, or the (for ammonia) very insoluble bicarbonate. Iron makers have a unique field for the manufacture of these salts, as they throw into the air thousands of tons annually of the very gases to make those salts in combination with the ammonia gas now captured by them in sulphuric acid which they have to purchase. The market prices ruling for these luxurious salts of ammonia simply put them out of reach of the sugar grower or agriculturist—running, as they do, from £30. to £45. per ton. If they were tackled by the iron kings, these salts could be produced to sell at £10. to £15. per ton, and show more margin to the makers than the sulphate they now produce; while the benefit to agriculture by the application of genuine plant food of a non-metallic or non-mineral nature would be simply incalculable."

## NOTICES.

### LONDON AGENTS

Booksellers and Newsagents may now obtain supplies of  
"THE CHEMICAL TRADE JOURNAL"

From

MR. JOHN HEYWOOD,

2, Amen Corner,

On usual trade terms.

Paternoster Row, E.C.

### FOREIGN REMITTANCES.

Owing to the inconvenience created by the various ways in which foreign subscriptions are remitted, we respectfully beg to inform subscribers that a *Crossed MONEY ORDER* is the most satisfactory method of remitting, both for them and ourselves. In the case of a Money Order, a letter advising us of same should always be sent, otherwise, owing to post-office formalities, much delay in tracing and acknowledging foreign remittances is inevitably entailed in this country.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are firm, 90's being quoted 2s. 6d. and 50/90's 2s. 2d. For forward, 90's 2s. 4d. to 2s. 5d. There is practically no change in the other tar products, carbolic acids being unaltered from last quotations, while naphthas are also without change. Pitch is firm at 32s. to 32s. 6d., f.o.b. East Coast.

Sulphate of ammonia is rather quiet, there being only a small business doing. Buyers are again chary, but on the other hand there is not much sulphate offering. Prices are:—London outside makes £8. 2s. 6d., Liverpool £8. 2s. 6d., Hull £8. 1s. 3d. to £8., and Leith £8. to £7. 18s. 9d. Nitrate quietly steady.

### LIVERPOOL MINERAL MARKET.

As is customary during the Whitsuntide holidays our mineral market has been practically suspended, and very little business done; works being closed, there have been practically no orders given out. During the last week, however, there has been a resumption of operations, and orders are now coming pretty freely, and prices on the whole are some-

ron-er. Manganese ore: Spot stocks for sale having been some weeks back, prices were strong and had advanced considerably, especially for the high class ore. The season for shipment, has now commenced, though yet on a small scale, for only cargoes, comprising some 7,000 tons, have been shipped, mostly to the continent, a small portion only coming to this market. The ore has been anticipated long before its arrival, so that it is little, if at all, affected, and in consequence of the slow movement of shipments and the probability of short shipments during the year, prices are not likely to recede to any extent. In fact, of the strong demand consequent upon the large orders for war, causing an increased consumption of this mineral, it is not likely that prices will see any reduction. The lower grades of manganese, which are fairly plentiful, are bringing higher prices, but only those of a special nature are wanted at any price. The higher grades of manganese are in request, and bring advanced figures, and are likely to continue to do so. Ground manganese continues unaltered with a good demand, at £6., £8., £10., and £12. 10s. per ton according to grade. Manganiferous iron ore continues scarce, and demand at slightly advanced figures. Chrome ore: Arrivals somewhat increased, and figures are rather easier. Bauxite continues with a good demand, with the probability of a material increase in shipment; prices, however, remain unaltered at 20s. for firsts, 18s. for seconds, and 12s. for thirds, f.o.b. French chalk: The higher grades are exceedingly scarce, in consequence of the past winter having caused a suspension of operations at the mines, and a consequent reduction of output; some of the finer brands are at present scarce, prices, therefore, are firm at 65s. to 70s., 80s. to 90s., and 100s. per ton, according to grade. Wolfram and scheelite continue in strong demand, and there are practically no stocks, except of the lower grades; high qualities of mineral will not be here for some time. Ferro-chromium and ferro-tungsten are in good demand, and are still excited, and higher prices are sought. Fuller's earth continues steady at the last quotations—50s. for lump, 55s. for ground, and 60s. per ton for impalpable powder. Ochres and umbers meet with a steady sale at 60s. for J.C. ochre, and 40s. for umber. Bog ore is in more demand for the higher grades. Bog ore is with further improvement in the demand. Magnesite sells but if the present uneasiness in the East should create further alarm, the consequence may be that exportations will be restricted, and figures will be enhanced when shipments cannot be made. Go continues to sell freely at £6. to £10. per ton for foundry's use, with prime Ceylon at £15. to £20. per ton. Carbonate and sulphate of barytes are quiet, without change to report. Fluorspar is in demand. Feldspar continues quiet.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

8.—Palm oil is steady; prices remaining unaltered, although it is decidedly indifferent. Sales have been made in both hard oils at about the same prices as ruled last week. There is a good sale being made in olive, in spite of the fact that the market is flagging somewhat; there is no change in values. Linseed oil, but Liverpool makes in export casks are still quoted 19s. 6d. per cwt., according to quality. There is nothing fresh to report in cottonseed, Liverpool refined standing at 16s. 3d. to 17s. and an 16s. 9d. to 17s. per cwt. The tone of the market for castor oil is steady, good seconds Calcutta selling at 2½d., ex quay, and an offer at 2¾d. to 2½d., ex store. Sales of first pressure French oil at 2½d. per lb. Tallow is moving rather better, but there is no notable change in values. Resin continues firm in price, with a little business passing. Spirits of turpentine are scarce, and firm at 6d. per cwt; forward continues to be offered at 20s. 9d. per cwt. American steady, but inclined to be quiet: American 6¼d. to 7½d., Russian refined 5¼d. per gallon.

COLOURS.—Prices are steady, and practically without change. Oxfordshire, common, £10., medium, £12., best, £15. per cwt.; hire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 60s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 65s. umber: 40s. to 45s. White lead, £16. and unchanged. Venetian red, £6. to £10. Cobalt: Prussian blue, 9s. 9d.; black, 9s.; blue, 6s. Oxide of iron: Common, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## THE METAL MARKETS.

LONDON, WEDNESDAY.—Pig iron, dull: Scotch warrants closed at 11½d.; Middlesbrough, 37s. 6d. cash, and hematite, 47s. 5½d. flat: Chili bars, G.O.B.'s and G.M.B.'s, closed at £47. to £48. 2s. 6d. cash, and £48. 3s. 9d. to £48. 8s. 9d. three

months. Tin, steady: Straits closed at £60 5s. to £60 15s. cash, and £60 15s. to £61 5s. three months; Australian, £61. 12s. 6d.; English ingots, £64. 10s. Lead, firm: Spanish, £11. 2s. 6d.; English, £11. 5s.; Silesian spelter, ordinary, £18. Nickel, 1s. 2d. Antimony, £30. 5s. to £30 10s. Quicksilver: First hands, £6 15s.; second hands, £6. 12s. 6d. Copper shares, firm: Cape, 2½ to 2¾; Copiapo, 2¼ to 2½; Libiola, 2½ to 3½; Mason and Barry, 3 to 3¼; Rio Tinto, 22½ to 23; Tharsis, 5½ to 5¾.

GLASGOW, WEDNESDAY.—Market better, with moderate business. Scotch done at 46s. 10½d., 47s., 46s. 10d., and 46s. 11½d. cash, also at 47s., 46s. 11d., and 47s. one month; closing with buyers at 46s. 11½d. cash, sellers ask 47s. Cleveland closes with buyers at 37s. 6d. cash, sellers ask 37s. 7d. Cumberland hematite done at 47s. 6d. cash, also at 47s. 8d., 47s. 7½d., and 47s. 8d. one month; closing with buyers at 47s. 5½d. cash, sellers ask 47s. 6½d. Middlesbrough hematite closes with buyers at 44s. 10d. cash, sellers ask 45s.

## REPORT ON MANURE MATERIAL.

The market has been quiet throughout the week, though a fair amount of retail business is passing. The quotations are—for 75/80% Florida phosphate rock 6d. per unit, for South Carolina 5¼d., and for similar grade Algerian 5¼d. per unit, in cargoes, less 2½%, c.f. & i. to good United Kingdom ports, 1896 steamer shipment. There is nothing fresh to report in River Plate bones. The position of East Indian bone meal is improved, there being no longer sellers at prices recently current. For May-June shipment £3. 12s. 6d. per ton is now lowest, and for autumn shipment £3. 15s. to £3. 17s. 6d. per ton required. For crushed Kurrachee bones £3. 17s. 6d. is the quotation for shipment. Nitrate of soda is quiet on spot, but fairly steady at 7s. 10½d. per cwt ordinary, and 8s. per cwt. for refined quality. In the forward position the market is quiet.

## MISCELLANEOUS CHEMICAL MARKET.

In the alkali trade there is nothing in the general situation to report in the way of change. Prices all round remain steady at figures which have been ruling for some time past. Ammonia alkali, under the arrangement of makers, undergoes no fluctuation, and stands at £3. 7s. 6d., bags, makers' works, and £3. 15s., casks, f.o.b. Caustic soda is in moderate demand, but no improvement in price is looked for. Current quotations are as follows:—F.o.b. Liverpool, 77%, £9. 7s. 6d. per ton; 74%, £8. 7s. 6d. per ton; 70%, £7. 7s. 6d.; 60%, £6. 7s. 6d. per ton, 10 ton lots and upwards. In Leblanc ash there is only a small business doing at 1d. to 1¼d. per degree, in casks, f.o.b. Bicarbonate steady at £6 12s. 6d., f.o.b. Soda crystals quiet at 35s., bags, f.o.r. In chlorates prices are weak: Potash at 4½d., and soda 6d. per lb. Saltcake firm at 22s. 6d., f.o.r. Recovered sulphur, £3 12s. 6d. per ton. Sulphate of copper, £18. 15s., f.o.b., with brisk demand thereat. Acetates of lime still in excess supply, and brown quoted £4. to £4. 2s. 6d., c.i.f. Acetate of soda steady at £14. 10s. Acetates of lead quiet and unchanged in value. Sulphocyanides rather easier. Yellow prussiate of potash has further declined to 6¼d. For potash, caustic and carbonate, there is still a fairly good inquiry, and prices are firm. White powdered arsenic continues in short supply, and price unchanged at £23. to £23 5s. for spot delivery. Sal ammoniac has been reduced, and now stands at 37s. and 35s. for firsts and seconds respectively.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

Although prices are all nominally upheld, the general market is, on the whole, even weaker than it was. Foreign competition, successfully prosecuted, is alleged by not a few to be the real cause of that lack of spirit in the home production, which has so long been a predominant and unwelcome feature. In special lines this week there is hardly anything that is new. Sulphate of ammonia holds the little it had, but does not do more, £8., spot, Leith, having been generally accepted on the part of sellers at the close of last week, though to-day the feeling after a higher fraction is a little stronger. Forward business at about 10s in advance of spot value was rumoured, but has not been confirmed. No change of any sort in mineral oils or paraffins, all being very idle, except the lubricants.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/56°, £4. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62° £6. 7s. 6d., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching

powder, £6. 17s. 6d. nett, Tyne; saltcake, 23s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4½d. less 5%, any port; nitrate of soda, 8s. to 8s. 3d.; sulphate of ammonia, £8. to £8. 1s. 3d., f.o.b., Leith; sal-ammoniac, first and second white, £39. and £37. nett, any port; sulphate of copper, £19. less 5%, Liverpool; paraffin scale, hard, 1½d. to 1¾d., and soft, 1¼d. to 2d. per lb.; paraffin wax, 120° semi-refined, 2½d. to 2¾d. per lb.; paraffin spirit (naphtha), 7d. per gallon; sulphur oil (burning) No. 1, 6¼d., and crystal, 6½d., at Glasgow and other big centres, for Scotch buyers (English sales ½d. to ¾d. lower); ditto (lubricating) 865° £4. 10s. to £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were 13,400 bags beet, unrefined, and 795 bags beet, refined.

### TYNE CHEMICAL REPORT.

TUESDAY.

In the chemical trade there has been very little doing over the holidays. The demand has only been quiet, and prices generally remain unaltered. Soda crystals, £2. 2s. 6d. per ton, gross weight, locally. Bleaching powder, from £6. 10s. to £7. 5s., according to destination. Sulphur scarce at £3. 17s. 6d. per ton.

Bleaching powder, softs, £7. 5s. per ton, nett; hard, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £4. per ton, nett; do., 50%, £4. 3s. 4d. per ton, nett; do., 52%, £4. 6s. 8d. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s. per ton, nett; do., 90-95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

SALT.—South Durham salt is firm at 9s. per ton, f.o.b. Tees, and business is fairly good.

COALS are perhaps a shade better, and best Northumbrian steam scarcer and in demand at 8s. 3d. to 8s. 6d. per ton; household coals, dull; and gas coals rapidly declining in demand. Prices are as under:—Best Northumbrian steam, 8s. 3d. to 8s. 6d. per ton; second qualities, 7s. 3d. to 7s. 6d. per ton; small steam 3s. 9d. to 4s. per ton; bunker coals, unscreened, 6s. 3d. to 6s. 6d.; gas coals, 6s. 6d. to 6s. 9d. per ton; household coals, 10s. to 10s. 6d. per ton; coke, in good demand, 15s. to 15s. 6d. per ton.

### HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

OILS.—The normal demand with which the holidays interfered can hardly be said to have returned, for the market is far from satisfactory. Linseed oil has declined in value, and refined cotton oil is steady at the decline of last week. The import during the week of linseed has been 5,080 quarters, viz., from Riga, 3,124 quarters; Bombay, 1,637 quarters; Königsberg, 250 quarters; and Catania, 69 quarters. Linseed oil is lower: spot, 17s. 6d., naked; June-August, 17s. 9d.; and September-December, 17s. 10¼d.; boiled and refined, £1. to £2. per ton extra. The export for the week has been 2,520 cwt. The

import of cottonseed during the week has been 2,212 tons, from Alexandria. Refined cotton oil is steady at the decline: spot, 14s. 3d., naked, buyers; and June-August, 14s. 7½d.; November-April quoted 15s. 3d.; casks £1. and ordinary barrels £1. 10s. ton extra. Export of refined oil for the week has been 5,960 cwt. Cas'or oil, 2½d. per lb. for first pressure. Cod oils, £17 to £18. per ton. Herring oil, £14. Turpentine unchanged. Boiled siccative oil, £12. per ton. American cotton oil soap, 70% fatty acids, is quoted 10s. per ton cheaper, £10 10s. per ton, in barrels. Locomotive grease, £10. 10s. per ton. Brown wool grease, £8. per ton.

CAKES.—Linseed cakes lower in price: 95% pure, £5. 10s. Oilcakes, £4. 17s. 6d.; Americans, £5; Russians, £5. 10s. Cotton cakes: Demand quiet, but prices steady; best makes, £3. 17s. 6d. seconds, £3. 12s. 6d. to £3. 15s. Rape cakes unchanged.

PAINTS.—Makers could spare but little time for holidays. There is a good demand for ready-mixed paints in tins, especially those brands of established reputation, prices being about £24. per ton. White and red leads unchanged. Dry mineral colours from £3. 10s. to £4. Various assorted paints in oil from £11. per ton. Good demand for lime blues, from £12. to £16., and ultramarines 3d. to 6d. per lb. Paint remover, £1. 5s. to £1. 10s. per cwt. Imperial black varnish, £5. 10s. per ton, in barrels. Varnish stains, from 8s. per gallon. Oak varnish, from 5s. 6d. per gallon.

### New Companies.

**Electrical Copper Company, Limited.**—CAPITAL £500,000. £1. shares of which 150,000 are preference. This company has been formed to acquire and work certain patents for the electrolytic treatment of copper and other metals. The subscribers to the memorandum of association are:—H. M. Matheson, 3, Lombard-street, E. merchant; C. A. Fould, 85, Avenue Morceau, Paris, député; Dumoulin, 19, Rue Miromesnil, Paris, propriétaire; A. McKee, Ditton-road, Widnes, smelter; R. M. Moir, 1, St. Swithin's-lane, E. merchant; R. Lorimer, 1, St. Swithin's-lane, E.C., merchant; I. Johnson, 197, Dalston-lane, N.E., clerk.

**New Julia Nitrate Company, Limited.**—CAPITAL £250,000. shares of 10s. each. This company is the outcome of the reconstruction of the Julia-Taltal Nitrate Company, Limited, the business of which has been taken over by the new company, which will trade as nitrate, iodine, and chemical manufacturers. The subscribers to the memorandum of association are:—G. Hume, 22, Budge-row, E.C., director of companies; J. T. C. Winkfield, 148½, Fenchurch-street, E. merchant; E. W. Vincent, 31, Broad-street House, E.C., merchant; W. Tremayne, Aldington-road, Streatham, merchant; T. Thackthwaite, Farnham Royal, Bucks, gentleman; F. S. Wells, Palace-road, East Molesey, gentleman; A. M. Jay, 17, Old Broad-street, E.C., stockbroker.

**Reddish Brick, Tile, and Pottery Company, Limited.** CAPITAL £10,000, in shares of £5. each. This company has been formed to carry on the businesses indicated in the title. The subscribers to the memorandum of association are:—T. Meadows, Heaton House, Stockport, contractor; W. Meadows, Heaton Chapel, Stockport, contractor; G. Everatt, Heaton Moor, near Stockport, manufacturer; F. W. Scott, Reddish, near Stockport, manufacturer; R. Hollingdrake, Edgeley House, Stockport, ironfounder; T. Torkington, Needwood, Stockport, manufacturer; T. L. Smith, Buxton-road, Stockport, manufacturer.

### Gazette Notices.

#### PARTNERSHIP DISSOLVED.

W. H. SMITH and T. GREENWOOD, under the style of Smith, Greenwood, and Co. proprietors and publishers of the "Oil and Colourman's Journal," the "Pottery Gazette," the "Hatter's Gazette," the "Decorator's Gazette," and "Plumber's and Gasfitter's Review," Ludgate Hill, E.C.

eer, at his Office, High Street, Huddersfield, to Mr. JOHN FREEMAN  
ered Accountant, 7, New Street, Huddersfield; to Messrs. RAMSDEN,  
Co., Solicitors, 80, Coleman Street, London, E.C.; or to

Messrs. RAMSDEN, SYKES & RAMSDEN,

Solicitors, 1, Westgate, Huddersfield.

5th May, 1896.

## FACTORY INSPECTION.

THERE is always much of interest in the annual report of  
Mr. Sprague Oram, and the last report of this gentleman  
as the Chief Inspector of Factories and Workshops is a  
worthy prelude to his retirement, which we understand is to  
take place shortly.

The report naturally deals very extensively with the textile  
industries, and in connection therewith is a most interesting  
collection of opinions on the much-discussed topic of steaming  
in weaving sheds. There is a most pronounced statement  
proceeding from Dr. Dunbar, of Blackburn, the sum and  
substance of which is that he is emphatically in favour of  
steaming, in reasonable moderation, as being conducive to a  
better state of health than would prevail if the practice were  
to be entirely abandoned.

There are, however, other items which more closely concern  
our readers. The most important of these relates to the use  
of solvents in rubber works.

Miss Anderson finds it difficult to refrain from the sen-  
sational, but she certainly has hold of a genuine grievance  
this time, and so should be allowed a little latitude in the  
matter of detail, as the effects of carbon bisulphide, in par-  
ticular, and also of benzine on operatives, are undoubtedly  
serious enough to warrant all reasonable preventive measures  
being adopted.

The symptoms are distressing, and more so perhaps on  
account of the indirect effects, but at the same time we feel  
assured that if the inspectors would co-operate with the  
manufacturers, and substitute a little sound advice and  
assistance for empty plaints, they would not find employers  
backward in adding them. Harrowing details, not wholly  
untainted by indirect exaggeration, owing to their being  
derived from somewhat isolated instead of typical cases, do  
not mend or even minimise the evil, while they are very apt  
to rumple the feelings of those who foolishly make enemies  
of inspectors.

This tendency is one that is greatly to be regretted as there  
is another way of looking at matters. If Government  
inspectors can only be looked upon as necessary evils that  
must be endured friction soon arises. It is always as well  
to avoid falling out with the powers that be, and though a  
friend at court may be only for the few, it is just as well to  
eschew all that may give offence to the courtiers you may  
come in contact with. Bearing this in mind, would it not be  
wiser to view the case in a different though admittedly  
selfish light? Inspectors will come—they have to come.  
Why not make a point of getting something out of each visit?  
Make them think for you. They have more time in which to  
do it, and generally will do it better. Instead of looking on  
inspectors as a crowd of faultfinders, miss no opportunity of  
turning them into counsellors. It should never be forgotten  
that manufacturers have a strong weapon in that they are

able to meet any suggested innovation by asking for a hint as to the wherewithal, and information on such points as efficiency and the best form of installation. This acts as a wonderful check, as the faddist soon finds his life becoming burdensome, whereas the man who speaks from experience, and whose words are prompted by the conviction that they are called for, is nearly always ready and willing to outline a scheme. Should it chance that he is not, for his own reputation's sake, as well as out of consideration for his official capacity, it is more than probable that he will have thought one out before his next visit. The results attained under the Alkali Acts have shown that this principle is feasible and advantageous if honourably applied by manufacturers. We say honourably advisedly, since it stands to reason that if an inspector suggests a policy, and can indicate a path by which it can be pursued, the same should at least be honestly considered by the employer. An additional feature is that in the case of a prosecution it is at least helpful to be able to point out that, desirable as the object in dispute might be, there were considerable difficulties surrounding it, since the inspector, with all his experience, could not throw any light on the matter. Thus, if the delay on the manufacturer's part is at all justifiable, he can strengthen his position by falling back on the inspector as it were. Of course if the latter has given reasonable assistance, then the manufacturer must look out for himself, as it is only right he should have to.

Where friction prevails, however, a working basis anything like the foregoing is impossible, and not infrequently trouble ensues. On the other hand, though at the outset the actuating motive would be the desire to get as much as possible out of the inspector, yet if this course were pursued, there is no doubt that concurrently with the alleviation of the friction between inspectors and the inspected, the original motive would certainly be replaced by a better one, and something akin to a feeling of comradeship would result. In consequence all would benefit—employer, inspector, and employed.

Reverting to the report of Miss Anderson, one of the most helpful sections is that giving the comparative conditions of labour in France and Belgium. From the comparison it appears that the imposition of an age limit, and regulations affecting ventilation, would not handicap the English rubber trade unduly. Miss Anderson has evidently been fortunate in securing an employer who has been through the mill as an allied supporter, and this combination of the ethical and the practical should bear good fruit. Cannot they suggest some palliative measures worthy of them?

### THE MINERAL OIL INQUIRY.

DR. STEVENSON MACADAM, professor of chemistry in Edinburgh, gave evidence on Friday last week before Mr. Mundella's Committee on Petroleum, and expressed a strong opinion that no oil used for illuminating purposes could be considered safe which had a lower flash-point than 100° Fahrenheit close test. He would not, indeed, prohibit the sale of oil with a lower flash-point, but he would insist upon its being labelled, so that the public who used it should know that they were dealing with an oil which was attended with danger. He mentioned that by abstracting 10 per cent. of the spirit from the American oil it could be brought up to the flash-point which he recommended without any difficulty, and that the cost of this process would not amount to more than 1/4d. per gallon. On the question of the danger from lamps, the witness differed from previous witnesses like Lord Kelvin in that he preferred a strong glass to a metal reservoir, because experiments which he had conducted showed that the metal reservoir raised the temperature of the oil considerably more. He had never known any accidents take place from the vapour thrown off by Scotch oil. The chairman pointed out that in France and Germany oil was sold at 70° flash-point, and there were comparatively few accidents. Dr. Stevenson Macadam said he would still insist upon

the 100°, and that if there were fewer accidents in those countries was probably due to the higher intelligence of the people. Mr. Cross, a Scotch member of the committee, remarked that he was to hear such a statement from a countryman of his own. The man: You may be sorry, but I am afraid the statement is on true. The committee adjourned.

On Thursday, Professor Mendeleef (who was present at the of the Russian Government) gave evidence. He said the open point in Russia was about 200 degrees Fahrenheit. The lamp-burn this oil cost between 5s. and 6s. each, because the common could not burn it in consequence of its bad smell. Experiments demonstrate the safety of this oil, Mr. Cumber lighted a pile of with ordinary petroleum oil, and by pouring on it six or seven of the high-flash oil, the fire was extinguished, showing that oil high-flash point was as innocuous as water. The lesser number of accidents in England than in Germany arose, in his opinion, from the fact that the people were more careful, although the flash-point lower and they burned a more dangerous oil. Continuing, he said the shale oil made in Scotland was always of the same standard whilst Russian and American petroleum was always changing year to year. The supply of petroleum in Russia was increasing the wells were filling up more and more every year. Referring to the number of accidents in Russia, the professor attributed the number in Russia to the high flash-point of the oil. In reply to Jesse Collings, witness said he had no statistics to prove that there were fewer in Russia than in England.—Mr. Jesse Collings: Then take it that all comparisons are mere guesswork? Witness said not a tabular statement to prove it, but he had formed the impression from reading both the English and Russian newspapers with recorded accidents.

### EXPORTS OF PETROLEUM FROM U.S.

THE Chief of the Bureau of Statistics, Washington, gave the following returns of the exports of petroleum and petroleum products for April, 1896. The total shipments were 65,000 gallons, compared with 76,984,728 gallons in April, 1895. The ten months ending April 30th, 1896, was 716,672,313, against 748,174,861 gallons during the same period in 1895. Details of the shipments are as follow:—

|                    | CRUDE PETROLEUM.          | Gallons.   |
|--------------------|---------------------------|------------|
| Total, April, 1896 | .....                     | 8,063,113  |
| " " 1895           | .....                     | 10,441,130 |
|                    | NAPHTHAS.                 |            |
| Total, April, 1896 | .....                     | 59,914     |
| " " 1895           | .....                     | 1,297,851  |

| Total, April, 1896 | .....                     | 4,487,651  |
| " " 1895           | .....                     | 4,314,601  |
|                    | RESIDUUM.                 |            |
| Total, April, 1896 | .....                     | 43,171     |
| " " 1895           | .....                     | 96         |

THE CHEMICAL MEASUREMENT OF WATER.—At the last meeting of the Institution of Naval Architects, Mr. C. G. Stromeyer, paper proposing a chemical means for the measurement of circulating water, the contents of reservoirs, the flow of streams for similar purposes. He endeavoured, in effect, to apply to the same principle of chemical measurement which has long been used for determining the composition of furnace gases. In the case of the latter, a careful analysis is made of the fuel and of the products of combustion, as first steps to the determination of the character of the furnace-working. Complicated though this method may appear, more accurate than any known process of direct measurement of gas current by an anemometer; and it occurred to Mr. Stromeyer a similar method, if simplified, might with advantage be applied to the measurement of streams of water. The first essential to the success of any such process is the selection of a substance, to be added in bulk of water, which can be detected in an extreme state of dilution by reliable chemical tests. Salt (sodium chloride) was selected to answer this purpose; and when applied in the manner described by Mr. Stromeyer in his paper, gave results accurate to 0.4 per cent. A still more accurate determination could be made if, instead of salt, the rather expensive chemical nitrate had been injected into the waters. The accuracy attainable by this substance is such that the capacity of one of the Tilbury gravimetric holding about 60,000 tons of water could be determined chemically within 1 per cent. of its true amount. For this purpose, only the nitrate would need to be dissolved in the water, of which ounces would serve for the analysis.

## The Patent List.

This list is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of E. Davis and Alfred R. Davis, who report professionally the value of Chemical Patents.

### APPLICATIONS FOR ENGLISH LETTERS PATENT.

**Regenerative Gas Furnaces.** F. Siemens. 11,433. May 26.  
**Obtaining Metals from Cyanide Solutions.** S. O. Cowper-Coles. 11,465. May 26.  
**Process for Manufacture of Carburetted Water Gas.** The Economical Apparatus Construction Co., Ltd., and L. L. Merrifield. 11,530. May 27.  
**Obtaining Valuable Products from Seaweed.** A. Krefling. 11,538. May 27.  
**Obtaining Sulphide of Aluminium which may or may not be combined with other Sulphides.** D. A. Peniakoff. 11,555. May 27.  
**Obtaining Gaseous Disinfecting Mixtures, mainly Formic Aldehyde.** H. L. 11,557. May 27.  
**Softening Apparatus.** H. L. Doulton and A. W. Manger. 11,559. May 27.  
**Obtaining Sewage.** G. T. Gillespy. 11,599. May 28.  
**Obtaining Rhea Fibre.** A. R. Wadell. 11,613. May 28.  
**Obtaining Gases.** H. Maxim. 11,621. May 28.  
**Obtaining Batteries.** E. J. Clulbe, A. W. Southey, and the Electric Motor Co., Ltd. 11,627. May 28.  
**Obtaining Water Gas.** J. E. Goldschmid and C. Dellwick. May 28.  
**Obtaining Chrome-dressed Leather.** K. Möller. 11,695. May 29.  
**Obtaining Insecticide.** F. E. Rutland. 11,716. May 29.  
**Obtaining and Purifying Water.** O. Guttman. 11,739. May 29.  
**Obtaining High Explosives.** S. A. Rosenthal. 11,746. May 29.

### EXTRACTS OF LATEST COMPLETE SPECIFICATIONS.

The abstracts are specially prepared for the Chemical Trade Journal, and the rights of publication are reserved. This is the earliest of abstracts of Chemical and allied patents accessible to the public.

**Improvements in Arrangements for Drying Slurry by the Waste Heat in Cement Kilns.** W. Joy, Snodland, Kent. Eng. Pat. 12,391. June 1895.

The waste heat from the cement kiln is caused to travel under a row of two or three chambers, placed one above the other, the floors of which are adapted for the reception of the slurry to be dried. The lower chamber is in connection with the kiln and the next chamber above it is the uppermost chamber, which has a roof of movable iron plates, constituting an open drying floor if desirable, is in turn in communication with the intermediate chamber and the chimney. In this way the gases pass from end to end of the chambers until they escape by the chimney.

Another arrangement is that of a chamber, with a floor adapted to the drying of slurry, communicating with the kiln, and having an arched roof which carries an open drying floor, the spandrels of the arches and spaces between them and the iron floor forming flues for the escape of the kiln gases. There are eight drawings.

**Improvements Relating to the Production of Acetylene Gas, and to the Utilization of the Same for Lighting Purposes.** G. Ragot, 163, Avenue de Wolxem, Forest-lez-Bruxelles, Belgium. Eng. Pat. 5,279. March 9, 1896.  
Acetylene is produced in an apparatus that works automatically. The features are the devices by which the generation of the gas is regulated according to the rate of consumption. Calcium or other material decomposed by water is of course the source of supply. The apparatus consists of two reservoirs, which can be fed automatically with water or carbide. These reservoirs are connected with a delivery which, by its upward and downward movement, effects the periodic admission of water into the carbide reservoirs. There is also a device for distributing the water so that it is delivered to the reservoirs alternately. In connection with the reservoir wherein the acetylene is produced there is a reducer which enables the pressure of the gas to be definitely lowered automatically, so that the gas assumes the required state. A special form of burner is described for burning the gas. There are seven figures.

**Improvements in the Manufacture of Artificial Stone, and Apparatus therefor.** W. P. Thompson, 6, Lord-street, Liverpool (communicated by La Société Anonyme La Néo-litho, of Moll, near Antwerp). Eng. Pat. 3,799. January 19, 1896.

The aim is to produce imitation sandstone which shall not be so porous as the product hitherto obtained. The use of agglutinants, increasing the degree of cohesion, generally produce a product

which resembles cement rather than sandstone. The patentee here endeavours to obtain a stone of close texture but possessing the characteristic porosity of sandstone. Sand and lime are treated under pressure with steam. There is no novelty in the conjoint use of these three, but novelty is claimed for the use of sand and lime together with steam alone without the addition of water.

A mixture of about 90% of sand with 10% of lime is treated in a special boiler, in moulds, at a pressure of five atmospheres, this being the minimum pressure at which stone of good quality can be obtained. The steam is admitted at two or three atmospheres until the mass is thoroughly saturated and the pressure then raised.

A high-pressure boiler of special construction is employed, being closed in front with a lid and fitted internally with tubes for distributing steam. There is also a track which conveys the moulds. The latter are formed of a frame of bars in combination with strong sheet plates, which are inserted at desirable points according to the size of stone to be made, and provided with openings for admitting steam. The plates are kept apart by flat iron struts, the whole being held together by tie-rods tightened by wedges.

**Improvements in the Extraction of Lead with Silver and Gold, or other metals, from Galena or Sulphides of Lead and Zinc, and from Mattes and (or) Refractory Ores.** H. E. Fry, 64, Billiter Buildings, E.C.; John David, Llwyndu, Glais, near Swansea; and C. Le Doux, 20, Woodfield-street, Morriston (R.S.O.), Glamorgan. Eng. Pat. 12,452. June 27, 1895.

The oxide and other compounds of zinc in the ores are removed by a flux which forms a fluid slag very free from lead. The flux is prepared in the following fashion: Seven parts by weight of burnt pyrites and about ten of nitrate cake or sulphate of soda are fused in a reverberatory furnace lined with basic bricks by preference, though a slag bottom will do. When in a semi-fluid state this flux is removed and allowed to cool.

The ore when prepared by a previous roasting to remove sulphides as far as possible, is smelted in a cupola furnace with 10 to 25% of the flux according to the nature of the ore. The amount of burnt pyrites added to the flux is also controlled by the amount of zinc in the ore. The lead is obtained as pig-lead, while the zinc is dissolved by the flux forming a thoroughly fluid slag, sufficient flux being used to ensure the attainment of this end.

Sometimes a little "matte" separates from the lead, forming a layer on the surface. This is carefully collected and exposed to the air, when in the course of a few days it disintegrates. The resulting powder is oxidised to remove the sulphur it contains and again put through the cupola, replacing an equal quantity of flux.

**Process for the Acidulation of Wools, Woollen Rags, or Tissues Intended to be Carbonised or Bleached.** G. Philips, Stolberg, near Aix-la-Chapelle, Prussia. Eng. Pat. 12,857. July 3, 1895.

By the ordinary treatment, if teasels and threads of cotton or flax are to be completely removed, it is necessary to use a fairly strong acid bath and to prolong the treatment. In consequence strong alkaline baths are necessary to ensure the complete neutralisation of the acid. Both of these conditions are injurious to the fibre of the wool.

To avoid this the patentee treats the materials under a vacuum. The vessel charged with the wool, &c., is sealed hermetically and coupled to an air-pump, by which it is exhausted as completely as possible. The connection with the acid reservoir is then opened and the acid is drawn in, care being taken to avoid the admission of any air. In this way the wool, &c., very soon becomes thoroughly saturated in a way quite unattainable in the presence of air under ordinary pressure. It has been found that by this method the same degree of carbonization can be obtained with an acid solution four or five times weaker than that usually employed. Naturally the injury to the wool fibres both in the acid and the subsequent alkaline treatment is very materially minimised.

**Manufacture of Vitreous Artificial Stone.** A. Hirsch, 30, Avenue de l'Opera, Paris. Eng. Pat. 14,187. July 25, 1895.

To produce imitation marble, coloured glass, or mosaics, a mixture of glass and ceramic ware, together with volcanic rocks such as basalt, is heated in a mould lined with refractory materials until partially or wholly fused. After the first fusion the moulds are placed in an annealing furnace and very slowly cooled. To produce a polished face a more easily fusible and finely broken mixture is placed in the bottom of the mould. In preparing mosaics rods of lead can be used to separate the tesserae and left to fuse into the mass. Colours can also be arranged by planning veins of suitable material which, when fused, produce a marble-like effect.

The final rocky or polished appearance is controlled by the stage to which the fusion is carried, experience showing when the mass has been fused sufficiently to form a solid and substantial block.

## Parliamentary Jottings.

### THE POLLUTION OF THE LEA AND THE BRENT.

In the House of Commons, last week, Mr. Cohen (Islington, E.), on behalf of Mr. T. H. Robertson (Hackney, S.), asked the President of the Local Government Board whether he was aware that the waters of the river Lea were polluted by the introduction of insufficiently disinfected sewage matter from the districts of Tottenham, Walthamstow, and Leyton, greatly to the detriment of the health of the inhabitants of South Hackney and other districts; and whether he could take any, and what, steps to prevent this infringement of the Rivers Pollution Acts.

Mr. Chaplin (Lincolnshire, Sleaford): As regards the pollution of the waters of the river Lea, I have been in communication with the district councils of the three districts referred to in the question. In the case of Tottenham, I am informed that the whole of the sewage of the district is pumped direct from the outfall works into the sewers of the London County Council. I do not find that the Local Government Board, during the last two years, have received any complaint in this matter as regards the Leyton district. With respect to Walthamstow, proceedings were instituted by the Leyton District Council for the purpose of obtaining an injunction to prohibit the pollution of the river by sewage from that district. An injunction was granted and the district council have submitted proposals for additional works with a view to preventing a continuance of the pollution. The Local Government Board have no authority to institute proceedings under the Rivers Pollution Prevention Acts; proceedings under these Acts may be instituted by the County Council or the council of any district affected by the pollution. Moreover, any powers which the Lea Conservancy Board have as regards the pollution of the river have been reserved to them by the Rivers Pollution Prevention Act of 1876.

Mr. Bartley (Islington, N.) asked whether the right hon. gentleman's attention had been called to the filthy condition of the river Brent after it received the sewage water from the sewage farm at Ealing, Middlesex; whether he was aware that this stream ran close to the large district schools with some thousand children, and through the densely populated district of Brentford; and whether he would cause a local inquiry to be made with a view of putting a stop to the serious danger to the health of the neighbourhood from this polluted stream.

Mr. Chaplin: The attention of the Local Government Board was directed last year to the condition of this river, and the Board, after obtaining a report from one of their inspectors on the subject, communicated with the Thames Conservancy Board and the County Council urging that action should be taken with the view of preventing the continuance of pollution of the river. In consequence of the reference in the question to the Ealing district, I have made inquiry of the council of that district, and am informed that there is no source of pollution within their district, and that, with the view of preventing pollution of the river by others, they have determined to take steps to obtain an injunction. With respect to the Willesden District Council, the effluent from whose works was regarded by the Thames Conservancy as unsatisfactory, the Local Government Board have now before them an application from the council for sanction to a loan for the improvement of their works of sewerage and sewage disposal. Powers of instituting proceedings for preventing pollutions are vested in the Thames Conservancy and the County Council, and I will again communicate with these authorities.

### DAINGEROUS EMPLOYMENTS.

On Thursday Mr. Schwann asked the Home Secretary whether his attention had been called to the statements of various inspectors (in the recent reports of Her Majesty's Chief Inspector of Factories and Workshops) that proper precautions were still not taken in india-rubber works to protect the workers, often women and girls, from the pernicious effects of sulphurous fumes, which caused various illnesses, nausea, and even paralysis; and also to the statement in the same report as to the absence in some hat manufactories of suitable fans and other means of ventilation to prevent the entry into the lungs of the workers of particles of fur and dust given off in the fur-blowing processes; and whether he had power, and would exercise it with renewed energy, to cause the proprietors in both industries to take every precaution to obviate the highly deleterious effects of these operations.

Sir M. White Ridley: Yes, sir; I have seen the statements of Her Majesty's inspectors. Both points are now under the consideration of the Committees on dangerous trades, and when I receive their reports I will consider what further precautions may be necessary.

### INSPECTION IN THE BRASS TRADE.

Replying to Sir H. Vincent,

Sir M. White Ridley said the special rules to carry out, so far as the law allowed, the recommendations of the Departmental Committee with regard to the further inspection of the brass trade had been accepted by 1,540 firms, and though 175 firms had raised objection, it was hoped to obtain their consent without having recourse to arbitration.

## IMPORTANT AMENDMENT OF THE AUTO-BILL.

THE Government Bill to amend the law with respect to the locomotives on highways was revised on Tuesday by the Committee of the House of Peers, Lord Herschell presiding. Earl of Morley, on behalf of Lord Thring, moved that not only certain restrictions at present applied to road engines be removed, but such a carriage should be allowed to draw one car, provided both together did not weigh more than four tons. This proposition was made in the interest chiefly of agriculture. Lord Harris, on behalf of the Local Government Board, opposed the amendment, on the ground that they were not yet sure that the concession already made to motors would be quite safe. Admitting that, from an agricultural point of view, it would be better to put produce into a separate than into the motor carriage itself, he still urged that they should till they saw the result of the legal relaxations offered by the Bill in its present form. The Earl of Cranbrook, referring to the fact that the measure would relieve horseless carriages from special restrictions of speed, expressed the opinion that they ought not to travel faster than four miles an hour. The Earl of Kimberley had heard, on the subject, seemed to him good authority, that auto-motors would not be successful unless allowed to draw one carriage each. The amendment was adopted by 34 votes to 16, the Government being defeated. Harris assured the Earl of Kimberley that there would be full power to protect bridges from injury by excessively heavy horseless cars. The Bill passed through committee.

## THE RIBBLE JOINT COMMITTEE.

ON Monday a meeting of the Ribble Joint Committee was held at the County Hall, Preston; Sir J. T. Hibbert (chairman) presiding. The report of the Chief Inspector was gone through, and the cases of several local authorities and manufacturers were adjourned for periods of from one to three months. Messrs. Potter and Co. of Almond's Mill, Darwen, were asked to attend the next meeting of the Committee, to show cause why proceedings should not be taken against them. The Clerk was instructed to apply to the Local Government Board for power to proceed against Messrs. J. and J. W. H. paper makers, Simonstone, Padham, and Mr. William Sumner, of Fulwood, the brook into which the effluent from the brewer being described by the inspector as a public nuisance. Mr. Naylor (chief inspector) drew attention to the disinclination of firms to use precipitants, and the Rev. R. C. Fletcher (Tarleton) said that this was probably due to economical motives, but they would have to consider the interests of the stream even at the expense of private firms. Mr. Gregory, who attended as a deputation from the Scotshaw Brook Company, Darwen, to show cause why proceedings should not be taken against them, said theirs was the eighth firm on the River Darwen. They had already spent £1,200., and it would probably cost them £500. more if they had to use a precipitant. Mr. Naylor said that the firms had spent a lot of money on the work, but it had been rendered useless because a few hundred pounds more were required. Mr. Gregory said their effluent was better than the water they took from the river. If they had to get the water quite pure they would be financially ruined, as they would not be able to sell their production. The Committee adjourned the matter for two months. Mr. Gregory consulted with the inspector as to the use of a precipitant. Mr. M'Kenzie and Co., calico printers, of Accrington, also attended to show reason why proceedings should not be instituted against them. They intimated that they were now using precipitants, and on promising an endeavour to improve their effluent, the matter was further adjourned for two months. A deputation attended from the Waterside Paper Company, Darwen, who had been detected depositing their sludge on the Darwen at night, and stated that this had been done through forgetfulness of a servant, who had had to be discharged. The Committee were of opinion that the circumstances were somewhat serious, but they consented to overlook the occurrence on the promise of the deputation to exercise more care in the future. Mr. Calvert, of Messrs. J. H. Calvert and Brothers, of Oakenshaw Printworks near Accrington, attended, and said that they had been prevented from proceeding with the concreting of their tanks by the frost at the beginning of March. It was stated that they had already been a considerable leniency, and they were granted a further adjournment of one month only. A deputation from the Roach Bridge Paper Company, Samlesbury, stated that they were the last firm on the river, and consequently received all the other firms' pollutions. A sample was produced, which the Chairman said was more like ink, and a sample considerably clearer was said to be the same water after it passed the firm's settling tanks. On promising to experiment with precipitants, the deputation were granted an adjournment of

The Clerk (Mr. F. C. Hulton) said the Croston Urban Dis-  
council had been asked to send a deputation to show why pros-  
should not be taken against them. He explained that notice  
edings was served on the 11th May, 1892, and an order of  
ained in February, 1893, and they were then allowed eighteen  
to carry it out. The order expired in August, 1894, and ab-  
nothing had been done, and they were now applying again for  
time. The Chairman said it seemed to him to have been a case  
not to do it." The deputation said negotiations were pending  
e Railway Company for land, and they expected the consent of  
al Government Board as to borrowing powers on Tuesday.  
airman said they would exercise still further leniency and allow  
other month, but they would assuredly take proceedings at the  
hat time. This concluded the business.

## THE COST OF CALCIUM CARBIDE.

issuance of the notice given in the *Journal* (466, p. 273) some  
eks back, we are now enabled, by the courtesy of the *Progressive*  
produce the report on the trials made at the instance of our  
sing contemporary, concerning the cost of manufacturing carbide  
m for the ultimate production of acetylene gas:—  
calorific value of acetylene is, according to Julius Thomsen,

molecular weight 64—40 parts Ca, 24 parts C.  
fic gravity when compared with air 0.91.  
ity at 32° and 30° bar. pr. 0.073 lbs. per cubic foot.  
r at 60° Fahr. at atmospheric pressure dissolves about one  
of acetylene.

odour of acetylene gas has been commonly compared with that  
c. Further observations lead to the belief that the odour  
by acetylene is more like that of phosphorous, due, no doubt,  
hosphide and sulphide of hydrogen present in the gas.

the explosiveness of acetylene, it has been found that a mixture  
volume of acetylene with one volume of air burns with a dull  
ne evolving dense black smoke; acetylene mixed with 1.25  
is own volume of air is slightly explosive. Explosiveness  
s until it reaches a maximum with about twelve times its  
of air, then gradually decreases in violence until one volume  
e 10.20 of air is non-explosive.

generally supposed that carbide of calcium quickly disintegrates  
omposes, giving its gas off at once; but it was observed during  
estigation at Spray, that numerous small particles of carbide  
le as refuse evolved some days later unmistakable evidence of  
ng considerable quantities of gas, notwithstanding the extreme  
e.

xperiments as to the poisonous quality of acetylene seems to  
en determined by Dr. Rosemann and M. Grehan, both of  
gree that under ordinary conditions, such as would prevail in  
of the gas as an illuminant, it is no more dangerous than the  
own gases.

heoretical yield of one pound of pure carbide of calcium, is  
f. dry gas per pound, measured at 60° Fahr. and under a  
: of 30 inches of mercury or approximately 6 c.f. it saturated  
uous vapour. The tests conducted for the *Progressive Age*  
average nett yield of 4.926 c.f. of moist gas per pound of nett  
or 4.696 c.f. per pound of gross carbide. The acetylene was  
lly pure.

de of calcium is now being manufactured in America, at Spray,  
y the Willson Aluminium Company; at Niagara Falls by The  
Company, and at the works of the Electric Smelting and  
ium Company, Lockport, N.Y.

rope, by the Electro Chemische Werke, at Bitterfeld, Prussia,  
ausen by the Aluminium Industrie Actien, Gesellschaft.  
rmany at the Manheim Works, at Baden. In France by the  
-Metallurgical Works, at Froges and Vallorbes.

ORT OF MESSRS. HOUSTON, KENNELLEY AND KINNICUTT.

te 16th and 17th of March, 1896, these gentlemen visited the  
carbide plant of the Willson Aluminium Company, at Spray,  
gham County, North Carolina, U.S.A., and made an examina-  
test of the process of manufacturing calcium carbide as there  
on.

T.—The plant consists essentially of a pair of electric furnaces  
ucing the carbide, electric generators for supplying the current,  
e for driving the electric generators, and suitable apparatus for  
ing and mixing the coke and lime required to charge the  
f.

INE.—The water motor is a horizontal twin Leffel turbine  
30" in diameter, and rated as capable, under 28 feet fall, of  
ing 300 H.P. at 206 revolutions per minute and  $\frac{3}{4}$  gate opening.  
e opening is controlled by hand.

ELECTRIC GENERATORS.—The turbine is belted, directly by tandem  
belts to two Thompson-Houston alternators, of the 14-pole, 120 KW—  
1,070 revolutions per minute type, giving a maximum effective pressure  
of 1,155 volts at full load. Each alternator is excited by a standard  
Thomson-Houston exciter of the 110 volt—18 amperes—2,500 revolu-  
tions per minute type. Both exciters are run by tandem belts from an  
outboard pulley on one alternator shaft. The terminals of the  
alternators are connected to a switchboard supplied with primary volt-  
meters, ammeters, and switches.

The mains from the switchboard run to a group of 16 alternating  
current transformers, eight to each alternator, representing a total  
capacity of 240 KW. or 321.8 H.P. These transformers are employed  
to lower the pressure from 1,000 volts at the alternator terminals, to  
100 volts at the furnace terminals. They are of the No. 4—15,000  
watt—60 cycle, Thompson-Houston type. The secondary coils of these  
transformers supply, in parallel, two bundles of copper cables leading  
to the furnaces, which are situated within a few feet of the switchboard.  
Each cable is about  $\frac{3}{4}$ " in diameter, and is composed of 123 separate  
wires. There are 16 cables to each furnace, eight to the upper and  
eight to the lower electrode.

FURNACES.—There are two open electric furnaces placed side by  
side in one brick structure. The side and partition walls are of ordinary  
brick, while the front is open but partly covered by cast-iron doors.  
The floor space in each furnace is 3' x 2' 6", and a height of about  
eight feet, they rise into a single short chimney, which serves to carry  
off the gases evolved during the operation of the furnaces.

At the base of the furnaces is placed a heavy iron plate about 6'  
long, by 2½' wide, and 1" to 2" thick. On this bed plate rest two  
carbon plates, 3' x 2½' x 6" to 8" thick, one in each furnace. These  
carbon base plates in connection with the iron plate form the lower  
electrodes. They are repaired from time to time with carbon left over  
from partly consumed upper electrodes. Their renewal thus involves  
no extra cost in materials.

The upper electrode for each furnace is a heavy carbon block 12" x  
8" in cross section, and 36" long. It is composed of six carbons, laid  
side by side, each 4" x 4", 36" long, and weighing, approximately,  
30lbs. The electrode is protected by a casing of 3-32" sheet iron. The  
interstices between the casing and the carbons are filled with a hot mix-  
ture of pulverised coke and pitch, so that the electrode becomes prac-  
tically a solid mass of carbon in intimate contact with an iron shell.  
The electrode is clamped vertically, in a metal holder supported by a  
vertical copper rod 3" x 3", passing through the roof of the furnace,  
to a chain running over a pulley to a hand-wheel by the side of the  
switchboard, so that the upper electrode can be raised and lowered at  
will by the switchboard attendant.

During use the upper electrode consumes at the rate of about 1-16"  
per working-hour.

MATERIALS.—The materials employed in the manufacture of calcium  
carbide are lime and coke, and, incidentally, the carbon of the electrodes.

CRUSHING AND MIXING MACHINERY.—The coke and lime are  
first passed through a crusher and are subsequently ground by rollers.  
They are then thrown in proper proportions into a revolving ball mixer  
provided with pebbles. The operation effects an intimate mixture be-  
tween the pulverised coke and lime.

METHOD OF OPERATION.—The coke and lime, after being separately  
pulverised, are weighed out in suitable proportions into the ball mixer.  
The lime is pulverised fine enough to pass through a 20-mesh sieve, and  
the coke is pulverised fine enough to pass through a 50-mesh sieve.

The chemical proportions required are given by the reaction,

According to this equation, 56 parts by weight of lime should be mixed  
with 36 parts of carbon to yield by combination 64 parts of calcium  
carbide. In other words, the mixture should contain theoretically  
60.87% of lime and 39.13% of carbon.

The material is taken from the mixer to the furnace, and the charge  
is started by throwing in a few shovelfuls upon the furnace floor, and  
establishing the arc through it between the upper and lower electrodes.  
At first the pressure and current at the furnace terminals are very un-  
steady, but, after the first quarter of an hour, they become moderately  
steady, at about 1,600 amperes, and 100 volts, respectively. Under  
the action of the arc, which is usually about 3" long, the mixture im-  
mediately under the surface of the upper electrode is gradually con-  
verted into molten calcium carbide. The carbide tends to fill up the  
space between the electrodes, so that the upper electrode has to be  
raised to maintain the arc, thus allowing the new mixture to fall in  
from the sides. Fresh mixture is shovelled into the furnace from time  
to time. Flames of ignited carbonic oxide, coloured by the volatilisa-  
tion of calcium, rise from the surface around the upper electrode, but  
are smothered as far as possible by stoking and packing. The switch-  
board attendant continues to raise the upper carbon electrode by hand-  
wheel, screw, and chain, according to the indications of the volt-  
meters and ammeters, until the electrode has been lifted through its  
full range of about 30 inches. The addition of new mixture is then  
stopped, and the current maintained, until the last portions added

have been sufficiently acted upon. The current is then cut off and directed into the neighbouring furnace, which is operated, while the first cools down sufficiently to permit of the withdrawal of the carbide in the solid form. This mass of carbide has roughly the form of a vertical prism of rectangular cross-section, slightly tapering towards the top. Its surface is coated with a slag containing carbon, calcium oxide, calcium carbonate, and calcium carbide. Below this surface is the mass of carbide, which remains fluid in its interior for many hours after the cessation of the electric current.

The quantity of mixture unconverted into carbide varies from 50 to 75% of the charge. This is removed and can be employed in the next charge. As, however, a part of the carbon in this mixture has been oxidised and carried off as carbon dioxide, a small quantity of fresh carbon in the form of pulverised charcoal is added to maintain the original proportion of ingredients.

**OUTLINES OF TESTS.**—Two complete runs were made in the same furnace, one on the 16th and one on the 17th of March. In each run the mixture put into and withdrawn from the furnace was weighed and carefully sampled, as was also the yield of calcium carbide. The samples of lime and coke, and of the mixtures before and after the runs, were placed in tin cans and labelled. Samples of calcium carbide were taken from the top, bottom, sides, and centre of the mass and placed in tin cans, the covers of which were soldered to prevent the entrance of moisture. All the samples were taken to the laboratory of the Worcester Polytechnic Institute at Worcester, Mass., and carefully analysed.

The electric power delivered to the primary coils of the transformers supplying the furnace during the runs were measured by a Thomson wattmeter. The indications of the voltmeters on the switchboard were also checked by a Weston voltmeter.

When the upper electrodes were lifted clear of the furnace charges, the power delivered to the 16 transformers on open circuit was  $3 \frac{1}{2}$  KW = 4.29 H. P., the primary pressure being 1,000 volts, and the exciting current 4.7 amperes.

#### DETAILS OF TEST:— FIRST RUN.

In the first run, 1,200 lbs. of lime and 800 lbs. of coke were placed in the ball-mixer, making one short ton of material. The analysis of the lime gave:—

|                                       | Per cent. |
|---------------------------------------|-----------|
| Water and Carbon Dioxide.....         | 4.55      |
| Silica .....                          | 0.28      |
| Phosphoric Acid .....                 | 0.014     |
| Iron and Aluminium Oxides .....       | 1.58      |
| Calcium Oxide .....                   | 88.86     |
| Magnesium Oxide.....                  | 4.27      |
| Alkali, Sulphuric Acid and Loss ..... | 4.46      |
|                                       | 100.000   |

The analysis of the coke gave:—

|                 | Per cent. |
|-----------------|-----------|
| Moisture.....   | 0.40      |
| Ash .....       | 8.60      |
| Sulphur .....   | 0.48      |
| Phosphorus..... | 0.0055    |
|                 | 9.4855    |

Of the 2,000 lbs. weighed into the ball mixer, 1,903 lbs. of mixture was weighed into the furnace representing a loss of 97 lbs. in the mixer or in transport.

The analysis of this mixture showed that it contained:—

|                                                                                   |               | Per cent. |
|-----------------------------------------------------------------------------------|---------------|-----------|
| Calcium Oxide .....                                                               | 995.6 lbs. or | 52.32     |
| Carbon .....                                                                      | 709.9 „ or    | 37.3      |
| Residue, Oxides of Magnesium, Iron, Aluminium, Carbon Dioxide, Moisture, etc..... | 197.5 „ or    | 10.38     |
|                                                                                   | 1903.0 „ or   | 100.00    |

The furnace run lasted three hours (4.0 p.m. to 7.0 p.m.) The mean total primary current was 156 amperes, and the mean primary pressure 1,000 volts. This approximately corresponds to a mean total secondary current of 1,560 amperes, at a mean pressure of 100 volts, supplied to the furnace. The total electric energy supplied to the primary coils of the transformers was 454.8 kilowatt-hours, or 609.7 h.p. hours, representing an average activity of 151.6 kilowatts, or 203.2 horse power. Allowing 5 per cent. loss in the transformers, the corresponding total energy supplied to the furnace is 432.1 kilowatt-hours, or 579.2 h.p. hours, representing an average activity of 144 kilowatts or 193.1 h.p.

On the morning of the 17th, the furnace was emptied, and 226½ lbs. of gross calcium carbide were recovered, with 1,332 lbs. of mixture unacted upon.

The carbide mass was coated with a slag. This slag contains so calcium carbide, since it gives off a little acetylene on treatment with water, but it was estimated that the amount of slag consisting of materials other than calcium carbide, weighed 16 lbs., leaving 210 lbs. of nett carbide in the mass.

The number of cubic feet of moist gas given from one pound of carbide at a pressure of 30 inches of mercury and a temperature of 60° was:—

|                                                    | Cubic feet |
|----------------------------------------------------|------------|
| Bottom of mass, mean of three determinations.....  | 4.55       |
| Centre of mass, mean of three determinations ..... | 4.80       |
| Top of mass, mean of three determinations .....    | 4.97       |
| Mean.....                                          | 4.773      |

Average sample of whole mass, mean of four determinations, 4 cubic feet.

The analysis of the mixture unacted upon gave:—

|                                                                               | lbs.    | Per cent. |
|-------------------------------------------------------------------------------|---------|-----------|
| Calcium oxide.....                                                            | 726.8   | 54.55     |
| Carbon.....                                                                   | 459.5   | 34.49     |
| Residue, oxides of magnesium, iron, aluminium, carbon dioxide, moisture, etc. | 145.7   | 10.96     |
|                                                                               | 1,332.0 | 100.00    |

#### SECOND RUN.

The second run was conducted in a manner similar to the first. 1,100 lbs. of pulverised lime were deposited with 800 lbs. of pulverised coke in the ball-mixer, making 2,040 lbs. of material. The analysis of lime gave:—

|                                        | Per cent. |
|----------------------------------------|-----------|
| Water and Carbon Dioxide.....          | 4.02      |
| Silica .....                           | 0.34      |
| Phosphoric Acid .....                  | 0.015     |
| Calcium Oxide .....                    | 89.00     |
| Alkali, Sulphuric Acid, and Loss ..... | 0.605     |
| Magnesium Oxide.....                   | 4.38      |
| Iron and Aluminium Oxides .....        | 1.64      |
|                                        | 100.000   |

The coke contained:—

|               | Per cent. |
|---------------|-----------|
| Moisture..... | 0.50      |
| Ash.....      | 8.50      |

Of the mixture, 1,891 lbs. were weighed into the furnace, making a loss of 149 lbs. in mixing, transport, and weighing out. The mixture contained, by analysis:—

|                                                                        | lbs.  | Per cent. |
|------------------------------------------------------------------------|-------|-----------|
| Calcium Oxide .....                                                    | 1,030 | 54.50     |
| Carbon.....                                                            | 680   | 35.97     |
| Residue, Oxides of Magnesium, Aluminium, Carbon Dioxide, Moisture, &c. | 181   | 9.53      |
|                                                                        | 1,891 | 100.00    |

The furnace run lasted two hours and forty minutes (2.0 p.m. to 4.40 p.m.). The total electric energy supplied to the primary coils of the transformers was 408.9 KW hours, or 548.1 H.P. hours, representing a mean activity of 153.4 KW, or 205.6 H.P. Allowing 5 per cent. loss in the transformers, the total energy delivered to the furnace was 388.5 KW hours, or 520.7 H.P. hours, representing a mean activity of 145.7 KW, or 195.3 H.P.

The mixture, all withdrawn from the furnace at 6 p.m., weighed 1,438 lbs., and contained:—

|                                                                               | lbs.    | Per cent. |
|-------------------------------------------------------------------------------|---------|-----------|
| Calcium oxide .....                                                           | 788.9   | 54.86     |
| Carbon .....                                                                  | 490.8   | 34.13     |
| Residue, oxides of magnesium, iron, aluminium, carbon dioxide, moisture, etc. | 158.3   | 11.01     |
|                                                                               | 1,438.0 | 100.00    |

The gross calcium carbide removed from the furnace at 4.30 p.m. weighed 203 lbs., with an estimated quantity of slag, as before, amounting to 10 lbs., leaving 193 lbs. of nett carbide.

The average yield of the nett calcium carbide, from an average sample of the whole mass, and four determinations, was 5.09 cubic feet of moist acetylene per pound, at a pressure of 30" of mercury, at a temperature of 60°F.

The results of these two runs may be tabulated as follows:—

#### YIELD OF CALCIUM CARBIDE IN TEST RUNS.

|                                | 1st Run. | 2nd Run. |

(To be concluded.)

OM IN RUBBER.—The price of best Para rubber has gone up the past few weeks from 2s. 9d. to 3s. 9d. per pound, and it is by the trade that 4s. or so may be reached. Owing to the sources of supply, the article, of course, easily lends itself to the action of speculators and cornerers. But neither speculation and for tyres is altogether answerable for the present high n. It seems that, owing to the recent dry season in the traders have not been able to get their rubber down from the reaches of the Amazon, though this state of affairs may be d any day, when it is believed prices will give way. A still kle, not to say sticky, commodity is gutta-percha, the particular of caoutchouc species which is used for cables, and whose f supply is almost entirely limited to the Malay peninsula. r four years ago, when the price stood at 2s. 9d. per pound, a hich was bringing a cargo of some hundreds of tons from re was lost. The destruction of what was to the particular market upply had the effect of forcing up the price to the neighbour- 8s. 6d.; and even to this day the market has never recovered e disaster, for present quotations are about double what they ore the unfortunate vessel went down with its valuable cargo.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzols are firm, and well held at 2s. 9d. for 90's and 2s. 4d. for 50/90's. For forward, July-December, the prices are 2s. 8d. to 2s. 9d. and 2s. 3d. respectively. Carboic acids are practically unaltered, quotations for 60% crude and 40% crystals being 2s. 1d. and 7d. Naphthas are inclined to be easier. So far there is no change in crude, which still stands at 8d., but solvent is quotably lower at 1s. 2½d. Creosote, 1d. Anthracene steady at 10½d. for 30% A, and 9d. for B. Pitch quiet at 32s., f.o.b., East Coast.

There is practically nothing fresh to report in the position of sulphate of ammonia. Prices have gone a trifle easier, partly owing to the absence of buyers, and partly through the action of the southern and northern markets. Makers on the whole, however, are firm, and in view of the covering that has to be done for June deliveries, it would appear probable that the demand will improve as the month progresses. There is still no quotation for prompt at Beckton. London outside makes to-day are worth £8. 2s. 6d., Liverpool £8. 2s. 6d., Hull £8., and Leith £7. 18s. 9d., all prompt.

### REPORT ON MANURE MATERIAL.

The recent rain is bringing in a few late orders, but apart from that the manure season is practically over. There is a fair amount of business doing for forward delivery, but manure makers are carrying forward considerable stocks, and their policy so far is to buy sparingly of material for next season. Shippers of Florida 75/80% phosphate rock having made heavy sales within the past few months, mostly for the Continent, are inclined to assume a firmer attitude, the raising being now on a much reduced scale. The quotation for U.K., however, remains 6d. per unit. The quotation for 58/63% Algerian phosphate is 5¼d., and for 63/70% grade 5½d. per unit, 1896 shipment. For South Carolina river rock sellers ask 5¼d. per unit, but for good lines 5d. would be accepted. A cargo of River Plate bones has been sold, but the price does not transpire. £3. 15s. is about the value for summer-autumn shipment, and this price would no doubt do for anything afloat. On spot £3. 15s. per ton is the value of Bombay bone meal. For June-July shipment there would now be buyers at £3. 12s. 6d. For August-September shipment £3. 15s. per ton is required, ex quay, Liverpool. There having been good demand for crushed Kurrachee bones for the Continent, and supplies not being very abundant at the other side, £4. is asked for shipment, but U.K. buyers will not pay the price. Nitrate of soda is easier in all positions, demand during the past two months having been disappointing, and larger stocks have been left to carry forward than was anticipated in early spring. On spot ordinary quality may now be had at 7s. 9d. per cwt., and refined at 7s. 10½d. Due cargoes, and cargoes near at hand, are scarcely worth more than 7s. 9d. per cwt. Autumn shipments are quoted 8s. 1½d. to 8s. 3d., according to position, ordinary quality.

### MISCELLANEOUS CHEMICAL MARKET.

In the alkali trade there is no marked feature of improvement either in bulk of business doing or in value of the products. Ammonia alkali is steady at the makers' quotation of £3. 7s. 6d. per ton, bags, f.o.r. works, and usual extras for casks and delivery f.o.b. Caustic soda all round is quiet, but without further change in prices, which are as follows:—F.o.b. Liverpool, 77%, £9. 7s. 6d. per ton; 74%, £8. 7s. 6d. per ton; 70%, £7. 7s. 6d.; 60%, £6. 7s. 6d. per ton, 10-ton lots and upwards. Soda crystals quiet at 35s., bags, f.o.r. Leblanc ash nominally 1d. to 1¼d. per degree, f.o.b. For bleaching powder there is rather more enquiry, and the reduction in price recently made for the United States trade will no doubt tend to increase the volume of business in this article. Sulphur remains at £3. 12s. 6d., f.o.r., and there is a fairly steady demand. Sulphate of copper, £18. 10s. to £18. 15s., f.o.b. In chlorate of potash and soda there is no further change to report, prices being steady at 4½d. and 6d. per lb. respectively. Acetate of lime, brown, £4. c.i.f., but only little business doing thereat. Other acetates and acetic acid are quiet, prices generally being rather in buyers' favour. For potash, caustic and carbonate, demand is still brisk and prices are firm. White powdered arsenic continues very scarce and £23. to £24. for spot or early delivery is nearest value. Forward sales done at £23. 10s. Yellow prussiate of potash quiet, with generally a lower tendency. Cyanide 98% 1s. 1d. to 1s. 2d. per lb. Sulphocyanides dull. Nitrate of soda steady with rather a firmer tone for future delivery. In chemicals, generally, both for home trade and export, business is far from brisk or satisfactory to producers.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

**OILS.**—Palm oil being scarce, owing to the small quantities being offered, remains fairly firm on the whole. Lagos has been done for July at £18. 15s. Olive is firm, there being a fairly good business doing in the better qualities. There is practically no change in linseed, Liverpool makes still being quoted 19s. to 20s. 6d. per cwt. in export casks. The market is steady. Cottonseed, though quiet, is steady at 16s. 3d. to 17s. for Liverpool refined. American, 16s. 9d. to 17s. per cwt. Castor oil is firm, particularly good seconds Calcutta, which is now quoted 2½d. to 2½d., with a good demand at these figures. First pressure French remains at 2¼d. to 2½d. per lb. Tallow continues to be firmly held, but there is virtually no business passing. Resin is quiet, save for the spot demand, which is satisfactory for common, full prices being obtainable. Spirits of turpentine in small quantities or for immediate delivery cannot be had under 23s. per cwt. For forward there are offerings at 20s. 6d. Petroleum is unaltered, with American 5¼d. to 7½d., and Russian refined 5¼d. per gallon.

**COLOURS.**—Prices are steady, and practically without change. Ochres: Oxfordshire, common, £10.; medium, £12.; best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 65s. Umber: 40s. to 45s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## THE METAL MARKETS.

**LONDON, WEDNESDAY.**—Pig iron, easy: Scotch warrants closed at 46s. 7d.; Middlesbrough, 37s. 4½d. cash, and hematite, 47s. 2½d. Copper, firm: Chili bars, G.O.B.'s and G.M.B.'s, closed at £47. 17s. 6d. to £48. 2s. 6d. cash, and £48. 2s. 6d. to £48. 7s. 6d. three months. Tin, steady: Straits closed at £60. to £60. 10s. cash, and £60. 10s. to £61. three months; Australian, £61. 5s. to £61. 10s. English ingots, £64. Lead: Spanish, £11.; English, £11. 2s. 6d.; Silesian spelter, ordinary, £18. 7s. 6d. Nickel, 1s. 1½d. Antimony, £30. 5s. Quicksilver, quiet: First hands, £6. 10s.; second hands, £6. 9s. Copper shares, steady: Cape, 2½ to 2½; Copiapo, 2½ to 2½; Libiola, 2½ to 2½; Mason and Barry, 3 to 3¼; Rio Tinto, 2½ to 2½; Tharsis, 5½ to 6.

**GLASGOW, WEDNESDAY.**—Market flat, with fair business. Scotch done at 46s. 9d., 46s. 7d., and 46s. 7½d. cash, also at 46s. 10d., and 46s. 8½d. one month; closing with buyers at 46s. 7d. cash, sellers ask 46s. 8d. Cleveland done at 37s. 6½d. and 37s. 7d. one month; closing with buyers at 37s. 4½d. cash, sellers ask 37s. 5d. Cumberland hematite done at 47s. 6½d. cash, and 47s. 5½d. one month; closing with buyers at 47s. 2½d. cash, sellers ask 47s. 3½d. Middlesbrough hematite closes with buyers at 44s. 7d. cash, sellers ask 44s. 8d.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

The general market remains on the whole as it was a week ago, complaint being as usual rife on the score of the want of activity. Sal ammoniac has been marked £2. down per ton. Sulphate of copper has been fluctuating from day to day, and was down a bit towards the end of the week, but is now on the mount again, at £18. 15s., and well called for at that. In alkalis there is a fair trade moving for home needs, but new orders from abroad are still scanty. Prices are nominally unchanged. Mineral oils and paraffins (excepting lubricants alone, which are in good case) find themselves now well into the dead season with very little moving, though prices are in no case further deteriorated. Sulphate of ammonia continues slow, though not additionally covered in price—say £8. to £8. 1s. 3d. prompt.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/52°, £4. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62° £6. 7s. 6d., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £6. 17s. 6d. nett, Tyne; saltcake, 23s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4¼d. nett, f.o.b. Glasgow); bichromate of soda, 3¼d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4½d. less 5%, any port; nitrate of soda, 7s. 10½d. to 8s. 1½d.; sulphate of ammonia, £8. to £8. 1s. 3d., f.o.b., Leith; sal ammoniac, first and second white, £37. and £35. nett, any port; sulphate of copper, £18. 15s. less 5%, Liverpool; paraffin scale, hard,

1½d. to 1¾d., and soft, 1¾d. to 2d. per lb.; paraffin wax, 12 semi-refined, 2¼d. to 2½d. per lb.; paraffin spirit (naphthal), 7d. per gallon; paraffin oil (burning) No. 1, 6¼d., and crystal, 6½d., Glasgow and other big centres, for Scotch buyers (English sales ½d. lower); ditto (lubricating) 865° £4. 10s. to £5., 885° £5. 1 to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar Greenock were nil.

## TYNE CHEMICAL REPORT.

TUESDAY

The chemical trade is steady, but with only a limited volume business. Prices remain unaltered. Soda crystals, £2. 2s. 6d. ton, gross weight, locally. Caustic, 76/77%, £9. 5s. per ton; 76/77. 10s to £7. 15s. per ton. Sulphur firmer, at £3. 17s. 6d. per ton. Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 10s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, soda ash, 48%, £4. per ton, nett; do., 50%, £4. 3s. 4d. ton, nett; do., 52%, £4. 6s. 8d. per ton, nett; alkali, 36%, £2. 10s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 52%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £6. 5s. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl harden £3. per ton, nett; pure white sulphate of alumina, £3. 17s. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium refined crystals, £6. 15s. per ton, nett; do., 90/95%, crude calc. £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, carbonate of alumina, £30. per ton, nett; aluminate of soda, 1 per ton, nett.

**SALT.**—South Durham salt is steady at 9s. per ton, f.o.b. Tees.

**COALS.**—Trade here practically remains unchanged, and, with exception of steam coals, the demand is only quiet. Coke continues excellent demand and very firm. Prices are as under:—Best North briar steam, 8s. 3d. to 8s. 6d. per ton; second qualities, 7s. 3d. to 7s. 6d. per ton; small steam 3s. 9d. to 4s. per ton; gas coals, 6s. to 6s. 6d. per ton; household coals, 10s. to 10s. 6d. per ton; bituminous coals, unscreened, 6s. 3d. to 6s. 6d.; coke firm, 15s. to 16s. per ton.

## HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY

**OILS.**—Business remains very quiet, and values continue in depressed positions. Linseed oil has declined in value, and refined cotton oil very quiet. The import during the week of linseed has been 37 quarters, viz., from the River Plate, 31,540 quarters; Riga, 4 quarters; Constantinople, 181 quarters; Kustendje, 1,557 quarters; Königsberg, 500 quarters; and Harlingen, 20 quarters. Linseed oil lower, and quoted: Spot, 17s. 3d., naked; June-August, 17s. 7½d. and September-December, 17s. 10½d. to 17s. 9d.; boiled and reboiled £1. to £2. per ton extra. The export for the week has been 1 cwt. The import of cottonseed during the week has been 2 tons, from Alexandria. Refined cotton oil is quiet: Spot, 14s. naked; June-August, 14s. 6d.; and November-April sold at 14s. casks £1. and ordinary barrels £1. 10s. per ton extra. Export refined oil for the week has been 5,140 cwt. Turpentine, 21s. per cwt. Olive oil quiet and unchanged. Herring oil, £14. oils, £17. to £20. per ton. Castor oil, 2½d. per lb. Boiled siccative oil, £12. per ton. Brown wool grease, £8. per ton. American cotton oil soap, 70% fatty acids, £10. 10s. per ton. Locomotive grease, £10. 10s. per ton. Belt dubbin, 12s. per gallon.

**CAKES.**—Linseed cakes steady: 95% pure, £5. 10s.; Russian, £5. 7s. 6d.; Americans, £5. Oilcakes, £4. 15s. per ton. Cotton cakes steady: Best makes, £3. 17s. 6d.; seconds, £3. 12s. 6d. R cakes unchanged.

**PAINTS.**—Makers busy, with a good all-round demand. White and red leads unchanged, also oxide of zinc. Dry mineral oil from £3. 10s. to £8. Various assorted paints from £11. per ton. Lime blues, from £12. to £16. Ultramarines, 3d. to 6d. per lb. Paint remover, £1. 5s. to £1. 10s. per cwt. Imperial black varnish, £5. 10s. per ton, in barrels. Varnish stains, from 8s. per gallon. Oak varnish, from 5s. 6d. per gallon.

## New Companies.

**Worcester Blue Brick and Fire Clay Co., Ltd.**—CAPITAL £2,000., in £1. shares. This company has been formed to carry the business now carried on at Westbourne Bridge Wharf, Amberley road, Paddington.

**Twyford's, Ltd.**—CAPITAL, £250,000, in £10. shares. This company has been formed to acquire and carry on the business of porcelain and fire-clay goods manufacturers, now prosecuted by T. W. Twyford, Hanley. The subscribers to the memorandum of association are:—T. W. Twyford, Cliffe Vale Potteries, Hanley, potter; H. Twyford, Moor House, Biddulph, gentleman; W. Weir, Hillesden, Newcastle, Staffordshire, manager; J. Tait, Lime Cottage, Wolstanton, traveller; W. Noake, 52, Clifton Terrace, Newcastle, Staffordshire, manager; G. Boreham, 25, Aynsley-road, Sheldon, Hanley, secretary; A. Martin, 3, Newcastle-road, Sheldon, Hanley, manager.

**Edward Ryan and Co., Ltd.**—CAPITAL £10,000, in £10. shares. This company has been formed to take over as a going concern the business of soap manufacturers now carried on by Messrs. E. Ryan and Co., at Cork. The subscribers to the memorandum are:—E. Ryan, Blackrock-road, Cork, merchant; W. I. Green, 1, Belgrave-place, Cork, merchant; M. D. Daly, 14, Great George's-street, Cork, merchant; J. Kelleher, Sunday's Well, Cork, merchant; J. C. Newsom, Patrick's-street, Cork, merchant; J. Ogilvie, Warren's-place, Cork, merchant; M. J. Stapleton, 60, South Mall, Cork, accountant.

**Roydon Brick and Tile Co., Ltd.**—CAPITAL £25,000, in £1. shares. This company has been formed to trade as brick and tile manufacturers, at Roydon, Essex, under an agreement between T. Quinn and J. Carolan. The subscribers to the memorandum of asso-

ciation are: W. Moss, 8, Leadenhall-street, E.C., merchant; L. R. S. Walcott, 1, Gray's Inn-place, Gray's Inn, agent; S. Greenslade, 9, Jelf-road, Brixton, builder; T. Quinn, 43, Marloes-road, Kensington, manufacturer; B. B. Anthony, Hill View, Twickenham, contractor; A. Slack, 56, Burghley-road, Highgate, clerk; F. H. Poskett, 35, Esmond-road, Kilburn, clerk.

**Oakley Collieries, Ltd.**—CAPITAL £19,215, in £1 shares. This company has been formed to carry on the business of colliery proprietors, coke and brick manufacturers. The subscribers to the memorandum of association are:—J. Dennis, Dalkeith, builder; G. Hill, 46, Frederick-street, Edinburgh, S.S.C.; W. Marshall Middlemas, 18, South Bridge, Edinburgh, clothier; W. Hunter, 28, Queen-street, Edinburgh, bookbinder; T. J. Pentland, Teviot-place, Edinburgh, publisher; A. Guthrie, 64, Frederick-street, Edinburgh S.S.C.; R. T. McGregor, 6, York-place, Edinburgh, solicitor.

rtisements, Announcements in the Directory Columns, and all Adver  
prepaid, are charged at the Tariff rates, which w be forwarded on

ments intended or insertion in the current week's issue  
the office by Thursday morning at the latest.

## CURRENT TOPICS.

### PAPERMAKERS AND POLLUTION.

THE papermakers of Great Britain are disposed to consider  
that with the growth of committees for enforcing the  
purification of rivers they ought to know their position  
better. Their chief complaint seems to be that there is no  
standard of purity, concerning which grievance they are  
anxious for the Government to receive a deputation.

Papermakers, however, are not the only people who are  
suffering from the absence of anything like a standard to  
work to, yet they are about the only trade that has gone so  
far as to worry the Government about the matter.

At first sight, for a body of gentlemen to pose as the puri-  
fiers of a river without first arriving at a decision as to the  
precise interpretation the word purification is to bear is em-  
phatically farcical. It must be urged on their behalf, how-  
ever, that there are difficulties that present themselves in  
deciding what degree of purity shall be attained, owing to  
the width of the limits within which the extent of the pollu-  
tion fluctuates at different points on a river.

The treatment of works' effluents is always a more or less  
difficult task, and varies in each locality, so that the difficulties  
the polluters have to cope with individually are great. The  
standard *crux* is, however, practically the only difficulty of  
magnitude the controlling committee have to contend with.

Of course, they need to exercise a constant watchfulness  
over all the polluters in their area, but that is a very different  
thing to investigating and solving a problem such as that of  
fixing a working standard.

The fact that this question has remained in abeyance so  
long is, we feel, a slight upon the intelligence of the Boards  
of control.

If the gentlemen in authority were to give this matter care-  
ful consideration, instead of shelving it by pleading that they  
only have to see that pollution is stopped, we feel sure that  
they would inspire with confidence all those they have to deal  
with. Moreover, they would find that after allowing for the  
particular exigencies of the streams under their surveillance  
they were quite capable of fixing upon a standard of purity  
that could be equitably enforced.

It is obviously unsatisfactory, not to say unjust, that a pol-  
luter should be compelled to stop polluting without knowing  
to what extent he has to purify, and when he will be able to  
say, "I have done what you demanded, and cannot justly be  
expected to do more." At present he never knows when he  
has done. He may put down a plant that turns out an  
effluent as good as his neighbour's, and then be told that his  
works are "inefficient."

The experience of the last six years tends to confirm the  
belief that it is because the authorities fear the advent of the  
day when a manufacturer can take up the position just out-

lined, that they still persist in the one-eyed policy of tabooing standards.

It has suggested itself to us that, in order to safeguard themselves, the authorities would fix excessively severe standards, and so the manufacturers would be the greatest losers in the long run. Such a possibility, however, is very remote. If really oppressive regulations were suggested it would not be a very difficult thing to show that the authorities were exceeding their rights, or out of their depth. At present it is well nigh impossible to do either, as they acknowledge no limitations in the matter of purity. It is very certain that if they had a definite standard to enforce, though it be different for each river, or even each reach of the same, the work of purification would progress with far greater certainty and satisfaction. The time element that is now becoming so troublesome would also be to a large extent eliminated, as it would be far easier to allot a time for the completion of works, and polluters would know just what they had to do.

#### THE IMAGINARY AND THE REAL.

About a year ago there was a great furore over the so-called devastation of the Falls of Foyers because they were to be utilized for the generation of power.

At that time we ventured to uphold the scheme for utilizing the ornamental, in spite of the flood of opposition that filled the papers. We then suggested that the best judges in the matter were those directly affected, and drew attention to the significant fact that the least opposition came from the neighbourhood which was to be "desecrated."

Explanatory statements were made at the time by the ruthless depredators, but they apparently did not count for much, because they were mainly confined to facts instead of being couched in the high-falutin' language of the alarmists. Since then twelve months have elapsed, and the about to be, now is; but the reality is a very different thing to the picture conjured up by those who confidently foretold the destruction of the falls and the conversion of the rural surroundings into a second Widnes.

As a matter of fact, the change promises to operate wholly for the better. The sudden rising of the water in winter will be avoided, while there is every promise that the storage provided to retain the water so suddenly accumulated will enable the falls as well as the works to be regularly supplied during the droughts of summer.

The electrical decomposition of pure alumina does not suggest air pollution or malodorous effluents, while the erection of a new hotel and model village, lit throughout by electricity, is unfortunately in no way reminiscent of worthy, but unsightly, Widnes. There are a few more comparisons that might be drawn between the future, as portrayed in the hysterical utterances of the well-meaning but unwise, and the reality as it reveals itself to-day. Such contrasts, however, would of necessity become more or less personal, as well as uncomplimentary, so we will abstain from drawing them. We have urged on previous occasions that personalities are not arguments, and we must act on our principle.

**EXTENSION OF AN ELECTRO-CHEMICAL INSTITUTE.**—The Electro-technical Institute of Darmstadt, Germany, has received about £20,000. from the Government for the purchase of new ground and for the enlargement of the buildings.

**POLLUTION OF THE SHIP CANAL.**—Recently, Messrs. Ockleston and Co., paper makers, Partington, were summoned at Altrincham, at the instance of the Mersey and Irwell Joint Committee, for causing poisonous liquid to flow into the Mersey and the Ship Canal. The offence was admitted, Messrs. Ockleston urging in defence that they had done all that was possible to meet the case. The bench fined them £5. and costs, and ordered a satisfactory effluent to be turned out within six months.

## Parliamentary Jottings.

### FERTILIZERS IN SOUTH VICTORIA LAND.

In the House of Commons, on Monday, in reply to Sir G. Baden-Powell (Liverpool, Kirkdale).

Mr Chamberlain said: A licence has recently been granted to Mr. T. Bowick to occupy so much land as lies within ten miles in any direction of Cape Adair with the exclusive right of removing guano and other fertilizing substances for three years, but there is nothing in the licence as to minerals. Sir J. Ross, in January, 1841, took possession of South Victoria Land in the name of her Majesty, but as to its area I have no definite information.

### THE RIVER BRENT.

**A**NENT the pollution of this river, which was before Parliament recently, the Rev. E. Barter, of the Rectory, Hanwell, has written to the *Times* calling attention to the "very serious danger" arising from the polluted state of the river. Mr Barter says:—"Last week a question on this subject was asked of the President of the Local Government Board in the House of Commons. It met with the usual stereotyped reply that inquiries had been made. Yes, sir, inquiries have been made at intervals during the last few years, but they lead to no result. The evil in all its repulsiveness has been exposed time and again, but all to no purpose; nothing has been done. I forward you enclosed a copy of 'Dr. S. Monckton Copeman's report to the Local Government Board on the sanitary condition of the river Brent, in the County of Middlesex,' dated October 31st, 1893, and I venture to fix your observation on the following extracts from it:—"I was informed that the greater portion of the water, which at one period had been accustomed to find its way into the Thames along the river channel, was now diverted by the Regent's Canal Company. . . . I learn, further, that no water whatever has been passed on to the river from the reservoir (Welsh Harp reservoir) for about four months. . . . At the present time, for all practical purposes, the effluent of the sewage farm may be looked upon as the source of the river Brent. . . . At different points throughout the course of the river below the reservoir crude sewage and other putrescent fluids are discharged into the stream by private owners and others.' What an indictment! justifying surely the extremest measures and the promptest measures! Yet since it was penned matters have been permitted to grow much worse, and the outlook in these parts has become very serious indeed. Can it be law that a company is allowed to rob us of our water by diverting it in the upper reaches of the river in time of drought, and to flood us out (as they do) in time of rain, all at their own arbitrary pleasure? Can it be law that sanitary authorities and private owners along the river banks are allowed to discharge their sewage (much of it admittedly in a crude state) into the stream? That the matter demands immediate attention is evident from the fact that there are serious outbreaks of diphtheria and scarlet fever amongst the thousand children of the Central London District Schools situated in this parish and bordering on the river, and also from the fact that during the last few months we have twice had to close our local schools owing to severe epidemics. The infant schools are now closed for this very cause."

### THE MINERAL OIL INQUIRY.

**G**IVING evidence before Mr. Mundella's Committee last week, Professor Atfield (London) said he attended at the request of the Corporation of the City of Glasgow, and he gave evidence relating to accidents from fire in that city from the years 1886 to 1895. In speaking of Mr. Spencer's recommendations, he said he would prefer that the reservoirs of the lamps should be made of good, strong, clear glass. The burners should be fitted with good screws instead of the bayonet-points now used. Some non-conducting matter should be used as packing between the vessel and the iron stand; and, as long as dangerous oils were used, the lamps should contain air-holes covered with wire. They should be constructed as simply as possible, with ready access for cleaning. The elongated burners, he thought, dangerous, because they heated the oil. There should be a wick-rod attached to the burner running down to the bottom of the container. Glass lamps were less dangerous than metal ones, because they were cooler. Metal lamps had advantages, but they heated the atmosphere very considerably, and so long as they used oils that gave off inflammable vapour under 100°F. the advantages were overbalanced in consequence of the increased risk due to that temperature. The costness of glass and other advantages more than compensated for the danger to which its brittleness subjected it. The only way, however, to ensure anything like safety was to raise the flashing-point of petroleum to 100° Fahr. The committee then adjourned.

Wednesday, Mr. Francis Bateman Allen, representing the Association, gave evidence to the effect that accidents from petroleum lamps were not out of proportion to the number of lamps in use. Neither were fires caused by them out of proportion to fires arising from other causes. He gave some instances from which he drew this conclusion. Under ordinary circumstances accidents to mineral oil lamps were impossible, and while it was in proper order it was almost impossible to cause an explosion. Mr. Allen, continuing, gave the results of some experiments made with lamps having glass reservoirs. He threw a dozen of them and what the result would be when the reservoirs broke. Out of three did not break, but in the case of the others which did break there was no explosion. He objected to the prohibition of glass containers as it was his opinion that it would be unwise. He suggested that it would be made compulsory that strong glass reservoirs should be used and that the use of thin common ones should be prohibited. His opinion was that strong glass containers were better than metal ones as the oil remained cooler, and there was not the necessity of replenishing so often. He suggested that it was not necessary to see whether the reservoir needed replenishing. To reason he attached very great importance.

## The Patent List.

It is compiled from Official sources in the Manchester Laboratory, under the immediate supervision of Davis and Alfred R. Davis, who report professionally value of Chemical Patents.

ICATIONS FOR ENGLISH LETTERS PATENT.

ire of Explosives. C. G. André and C. H. Curtis. 11,842. June 1.

ACTS OF LATEST COMPLETE SPECIFICATIONS.

Abstracts are specially prepared for the Chemical Trade Journal, RIGHTS of publication are RESERVED. This is the earliest abstracts of Chemical and allied patents accessible to the

for Reducing certain Metallic Oxides by means of Amalgams  
like Metals. L. Mond 20, Avenue-road Regent's Park London.  
L. 1202 June 20, 1895

(modification of the principles involved in the electrolytic reduction of chloride of sodium with a mercury cathode to the reduction of oxides that are soluble in caustic alkalis). A solution of zinc oxide in caustic soda is placed in a cell and an anode of zinc is introduced. A piece of iron or zinc (or any metal suitable for the amalgam) is introduced. This piece of metal is connected by a conductor to the amalgam. An electric action ensues, the iron being oxidised, while the zinc oxide is reduced and deposited on the zinc cathode. The latter should by preference be cylindrical and constantly rotated, so that the deposit may be homogenous. The action may be hastened by reinforcing the current produced in the cell. In this way no hydrogen gas is evolved, and consequently there is no trouble or danger attending the use of mercury, as it does not volatilise and pass off with the escaping hydrogen.

Working Metallic Sulphides. A. Von Siemens 94, Markgrafen-  
berlin Eng. Pat. 7,123 April, 1895.  
The process is a distinct departure from the Borchers method, and is  
an extension of the Siemens-Halske process, resulting in the  
improvement of the process, and utilisation of bye-products without the

introduction of any new raw materials. The departure is based on the fact that the sulphhydrates and sulphides of the alkaline earths possess similar properties to the corresponding salts of the alkalis.

Taking, as an example, sulphide of antimony, this is treated with a lye of calcium sulphhydrate, the escaping hydrogen sulphide being collected. The whole of the gas in this case, however, is not evolved during the extraction process, the remainder coming off in the electrolytic treatment, during which the antimony is deposited.

The lye, after being freed from antimony, is treated with carbon-dioxide, whereby half the sulphur is driven off as hydrogen sulphide, while the other half is precipitated as free sulphur, together with carbonate of calcium. The gas is, of course, collected. The precipitate is heated to redness, out of contact with the air. The sulphur distills over while, the carbonate is decomposed, furnishing carbon-dioxide for the treatment of the spent lye as just described. The resulting caustic lime is employed along with the hydrogen sulphide to prepare fresh sulphhydrate lye. In this way not only is the metal obtained, but the whole of the sulphur is turned to good account.

## Improvements in the Manufacture of Cyanides and Ferrocyanides from

Sulphocyanides, and the Recovery of Bye-products. J. Raschen and J. Brock, both of G 11, Exchange Buildings, Liverpool. Eng. Pat. 30,475. May 27, 1905.

The separation of the sulphur in the sulphocyanide is effected by means of nitric acid, which converts the sulphur into sulphuric acid and liberates the cyanide in the form of hydrocyanic acid. The presence of chlorides in the raw materials should be avoided. Taking sodium sulphocyanide as an example, it is mixed with about five times its weight of water and heated to about 96°C. in a closed vessel fitted with an inlet pipe for nitric acid and an exit for the gases given off. It is also advisable to have a stirrer fitted in the vessel. There should always be an excess of acid, and air must be excluded to avoid the oxidation of the nitrogen oxides. The following reaction takes place:—

The gases evolved are passed through a solution of caustic alkali or an alkaline earth in a suitable absorber. The hydrocyanic acid combines with the alkali, but the nitrogen oxides pass on into another apparatus where they are mixed with air and steam and reconverted into nitric acid. The solution from the absorber can be evaporated to dryness in a vacuum pan, but the residue should not be heated to the fusing point of the cyanide. The reason for this is that traces of higher oxides of nitrogen are present in the gases passing to the absorber and are absorbed along with the hydrocyanic acid. If the cyanide is to be obtained in the anhydrous state, these traces must be removed by passing the gases through hot water in the manner described in patent No. 21,678, 1895. Ferrocyanides can be obtained by subsequent treatment on the usual lines. The absorber should be worked under a slight vacuum so as to avoid the escape of any hydrocyanic acid, but at the same time care must be taken to prevent the entrance of air as far as possible.

## Improvements in the Manufacture of Cyanides and Ferrocyanides from

Sulphocyanides, and the Recovery of Bye-products. J. Raschen and I. Brock, both of G 11, Exchange Buildings, Liverpool. Eng. Pat. 10 926. June 1, 1895.

This patent is substantially the same in principle as the foregoing, the only difference being that other oxidants are suggested in lieu of nitric acid. Thus, a nitrate, chromate, peroxide of lead, manganese oxide, or the like is used in conjunction with water and sulphuric acid. The precautions and working conditions described above apply in this case the same as in the other, there being practically no difference between the two processes.

## STATE OF THE CHEMICAL TRADES.

**S**HORT time is being worked in several of the chemical factories in the Tyne and Wear district, but copper works are busy. Things are also better with cement and white lead makers. Salt workers at Middlesbrough are fairly well employed, but otherwise trade is rather quiet. In the Manchester district flint glass makers, paper stainers and soap makers are moderately employed. Pulp workers at Barrow-in-Furness are busy. In the Liverpool district glass bottle makers are actively engaged, but the chemical trade is only moderate. Stoppages for re-construction have affected employment in the chemical works at Middlesbrough, but the salt trade at Winsford has been fairly good. The oil industry has been bad at Hull and district, but the paint trade has been good on the whole. At Nottingham dyers are dull, and the same may be said of bleachers. There has been a decided improvement in the flint glass trade at Brierley Hill, and in the neighbourhood of Wolverhampton chemical and tar distilling works are doing well, while oil and colour works are busy. There are favourable reports of the state of trade at chemical works in the Ruabon district, but the reports from South Wales are less satisfactory.

## Official Memoranda.

(From the Board of Trade Journal.)

### THE GERMAN-JAPANESE COMMERCIAL TREATY.

Under this treaty the following duties are charged upon German goods imported into Japan:—

| Article.                            | Duty.                   |
|-------------------------------------|-------------------------|
| Amorphous Phosphorus.....           | 10% <i>ad valorem</i> . |
| Subnitrate of Bismuth .....         | 10 "                    |
| Bromine .....                       | 10 "                    |
| Quinine.....                        | 8 "                     |
| Chlorate of Potash .....            | 10 "                    |
| Dynamite.....                       | 10 "                    |
| Arsenite, or Iodide of Potash ..... | 10 "                    |
| Nitrate of Potash .....             | 5 "                     |
| Salicylic Acid .....                | 10 "                    |
| Aniline Dyes .....                  | 10 "                    |
| Alizarine Dyes .....                | 10 "                    |
| Logwood Extract .....               | 10 "                    |
| Oil Paints .....                    | 10 "                    |
| Paraffin Oil .....                  | 10 "                    |
| Paraffin Wax .....                  | 3 "                     |
| Portland Cement.....                | 5 "                     |

### NEW CUSTOMS TARIFF OF MAURITIUS.

The following duties are now levied on articles entering Mauritius:—

|                                                                                                                                                                                  |                  | Rs. | c. |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|-----|----|
| Sulphur, Common .....                                                                                                                                                            | per 100 kilos.   | 0   | 70 |
| " Refined.....                                                                                                                                                                   | "                | 1   | 30 |
| Candles, Paraffin.....                                                                                                                                                           | "                | 3   | 0  |
| " Sperm .....                                                                                                                                                                    | "                | 3   | 0  |
| " Wax .....                                                                                                                                                                      | "                | 10  | 0  |
| " Composition .....                                                                                                                                                              | "                | 3   | 0  |
| Cement.....                                                                                                                                                                      | "                | 0   | 30 |
| Charcoal .....                                                                                                                                                                   | "                | 0   | 10 |

### MINOR TARIFF CHANGES.

WOOL WASTE imported into Russia is now dutiable at 30 (gold) per pood.

PLATINUM articles used for technical purposes in which platinum is exclusively employed, are to be admitted into Sweden free. This change will probably come into effect soon.

PARAFFIN, whether purified or not, when presented for clearance into Lisbon will in future have to pay a duty of 2 reis (0.1d.) per kilo.

FERTILIZERS, whether natural or artificial, including guano, will have to pay an import duty of 5 centimes per 100 kilos entering Spain, *through the port of Barcelona*. These articles in addition to those enumerated in sections No. 5, 251 and 252 of the tariff. The duty has been imposed to provide for the construction of a new Custom House at Barcelona.

SODA ASH mixed with soap, the former being the chief ingredient, is dutiable in the United States of America at one quarter of a cent per pound, which is the rate for soda ash under par 67.

### NEW GERMAN IRONWORKS IN SOUTH RUSSIA.

Her Majesty's Minister at Dresden states that the spirit of enterprise is now the rule in every department of German industrial activity.

As an example of this, the "Dresden Bank" has lately acquired with the great Chemnitz machinery house (Hartmanns) to open extensive ironworks at Lugansk, in South Russia. The land is purchased and the buildings are well advanced. It is intended to erect wide foundries with furnaces for the Martini-Siemens process. There will be a branch for constructing railway apparatus and machinery. The locality selected is described as abounding in coal and ores, as blast furnaces, and as being well supplied with skilled labour.

### BRITISH TRADE IN THE CYCLADES.

Her Majesty's Consul at Syra states that the development of trade in the Cyclades Islands rests mainly on the amount of enterprise activity exhibited in competing with foreign markets; this, unfortunately, does not appear to extend much beyond the distribution of a few catalogues and circulars, and there is not even the shadow of a commercial traveller. If British manufacturers wish to retain their position on these markets or open up new ones, it certainly would be a waste of time for a smart traveller, able to speak French, to make an occasional visit to that part of the world, not merely as a representative of a single firm and only one class of goods, but of various manufactures, such as oils, paints, dyes, chemicals, perfumery, cutlery, goods, hardware, lamps, rope, hats, yarns, cotton stuffs, silks, machinery, earthenware, and glass; this could not fail to produce an increase of business and profitable results.

### SWEDISH WOOD PULP AND SUGAR TRADE.

The wood-pulp industry has been increasing rapidly of late in Sweden. At the end of 1893 there were 93 factories in operation producing in that year 96,000,000 kilos.

The development of the beet sugar industry has been very successful. In the year 1890 there were only four factories in operation, but others have been set up each successive year, so that at the present time there are eighteen in operation, producing nearly 100,000 tons of raw sugar annually.

INCREASED FACILITIES FOR OIL AT BATOUM.—The deepening of the port of Batoum to 26 feet at the naphtha loading is now finishing. The mole is to be extended to a length of 1,700 feet so that the port can serve as a station for the Black Sea fleet in all weather. With this purpose in view the Government has appropriated 5,000,000 roubles on the port, and now 750,000 roubles have just been granted to continue the work.

LIVERPOOL PORT DUES ON SALT.—The Salt Union, which has made a communication to the Liverpool Chamber of Commerce, subject of the duties charged at this port on salt, and to the desirability of their reduction, have been asked for a further detailed statement showing how this port compared with other ports in the matter of salt duties, and they have been informed that such a statement, if required, would be laid by the Chamber before the Mersey Docks and Harbour Board, with a request that the question should be recom-

## Reports of Companies.

### SMOKELESS POWDER CO., LTD.

Report of the directors for the year ended March 31st last states that there was a considerable increase in the home orders for S.S. powder, the sales being about 10% in excess of the previous year. The total sales, however, were considerably less, owing to a part order having been shipped in March, 1895, which was not in 1896, but which they fully expect to receive within the next six months. They have also to report a large increase in the sales of powder of the "Rifleite" class. Owing, however, to increased competition from cordite and similar powders which are now manufactured by a number of private firms, the prices obtained have been in the previous year, which accounts for the somewhat smaller gross profits. At the Bisley meeting of the National Rifle Association last year no less than five powders were represented and for competition. The company's "Rifleite '303" powder with the top score and top average in all the 900 yards '303 breech-loading competitions, the best score being that of the 2nd V.B. Liverpool, 48 out of a possible 50. In the last twelve months the company's works manager and he have been actively engaged in preparing and perfecting a powder "Rifleite" class for sporting purposes. This powder has now entered on the market under the name of "Shot-Gun Rifleite," and the directors believe it to be a valuable addition to the company's stores. With a view to the extension of the company's business the establishment of further agencies abroad, the directors expect the secretary should make a prolonged tour through the States and Canada, New Zealand, and Australia, returning to India and Ceylon. His visit to the former resulted in good results in the States and the establishment of a fresh agency in London from which it is anticipated that a new and profitable business will be opened up during the coming year. Unfortunately, he was unable to complete his tour, being obliged to return to England owing to the expected death of the late managing director. As arranged at a meeting in June last, the directors thereafter offered for sale 7,000 of the unissued shares to shareholders and their whole of which were applied for, and allotted. The proceeds of the issue were utilised in the repayment of the sum of £3,781, and in the payment of loans at interest due by the company as shown in the balance-sheet; £2,258, being devoted to the extensions required at the time which were completed in July last. With the increase of 52,897 shares of £1. each, with 18s. paid, the directors were enabled to make an application to the Stock Exchange Committee for quotation of the company's shares, which they have much to their credit in stating was granted in September last. After writing off of the amount charged to suspense, the accounts show a profit of £1,284, at the credit of profit and loss, out of which the directors recommend that a dividend be paid at the rate of 2½% for the year ended March 31st last, which will absorb £1,190., and that the balance be carried forward.

### GREENWOOD AND BATLEY, LTD.

The directors, in their report for the twelve months ended March 31st last, after providing for the interest on the debentures and expenses of management, writing off the sum of £5,000. for the year, and making a provision of £650. for doubtful accounts, the accounts show a net profit of £11,576., and a balance from last year, there is a sum available of £12,045. The directors recommend that a dividend of 10½ per cent., being 7 per cent. for the year 1893-94 and half of the sum in the year 1894-95, should be paid on the preference shares, which will absorb £10,541., leaving a balance of £1,504. to carry forward. The directors are glad to state that the works are fully at the present time, and the contracts on hand and in hand give good reason to hope that the results of the current year will prove satisfactory.

### PACCHIA JAZPAMPA NITRATE CO., LTD.

At the annual general meeting of this company was held on Tuesday, the 18th inst., at the residence of Mr. J. J. Smith presiding. After expressing regret at the death of Colonel North (the late chairman of the company), the chairman moved the adoption of the report, remarking that there had been a loss on the year's working of £27,298. and, after the amount brought forward, a balance of £15,317. to the debit of profit and loss account. The loss on manufacture had been £10,250., the balance being made up by the loss on the year. He hoped that there would be no recurrence of the loss and there would not be if he had any voice in the matter. He wished for combination had now been settled, and, although the prices had not as yet arisen, he had no

doubt that this was only delayed in consequence of the large stocks of nitrate at present on hand. They had every reason to believe that the selling price would advance, and that they would be able to make good profits. The profit on exchange during the year was £8,306. A large number of oficinas had availed themselves of their option to work on trial for three months from March 18 last, in order that their annual quota of manufacture might be determined. The stocks of nitrate and cargoes afloat had been taken at their probable selling value, but the iodine had been taken at cost price. The motion having been seconded, a long discussion followed, in the course of which considerable dissatisfaction was expressed at the report, and an amendment was proposed in effect rejecting it. The chairman, in reply, at the close of the discussion, stated that the directors had received no fees for their services, while they had had a very anxious time. He strongly denied, on the part of his colleagues and himself, that any speculation had been engaged in by them in the company's shares; the Board had done nothing to influence the market in any way. The company's financial position would not allow them to keep large stocks in hand, and if they had closed the works they might not have been able to obtain the labour when they had to resume operations. The current year's working had been better, and he hoped they would be able to submit a more favourable statement at their next meeting. The amendment was eventually withdrawn, and the original motion was subsequently adopted.

### LAUTARO NITRATE CO., LTD.

The report made up to December 31, 1895, shows a net balance, after allowing for depreciation of grounds, plant, etc., and the appropriation for sinking fund for redemption of debentures, of £52,278, making with the balance brought forward £58,541. An interim dividend of 5 per cent. was paid in January, and the directors now recommend a further dividend of 5 per cent., making 10 per cent. for the year, leaving £3,541. to be carried forward.

## IMPORTS AND EXPORTS FOR MAY.

THE Board of Trade returns are not quite so favourable as during the earlier months, but chemical items in the imports do not seem to have suffered greatly. In the exports alkali cuts a sorry figure, but salt shows an increase of rather better than 10%. Iron and steel have also an improvement to show.

(Before Mr. Justice Collins without a Jury.)

THE MAGNOLIA ANTI-FRICTION METAL COMPANY OF GREAT BRITAIN v. FINLAY AND ANOTHER

THIS was an action for an injunction to restrain the defendants from interfering with the plaintiffs' business, by offering for sale a certain metal used for bearings in machinery, and called Magnolia metal. Magnolia metal was manufactured by the Magnolia Metal Company, of New York, the plaintiffs being the agents for the sale of the metal in this country, under a contract dated February 16, 1894. In 1891 and 1892 a German firm manufacturing similar metal began to compete with the plaintiffs, the Germans selling at £37. 10s. per ton, whereas the plaintiffs' price was £112. In June, 1893, the German firm commenced proceedings against the Magnolia Metal Company, attacking their patent for the manufacture and sale of magnolia metal. The defendants, representing the Magnolia Metal Company, at the instance of the plaintiffs, instructed solicitors to defend the suit. After proceedings were taken the plaintiffs furnished the necessary funds, and claimed to be allowed to deduct the amount so paid from the price of the metal forwarded to them, and they further refused to pay for the metal sent them unless the defendants, representing the American Company, paid the solicitor's costs. The plaintiffs, in the name of Lawlor, commenced an action in New York against the Magnolia Metal Company, in the pleadings of which they claimed that the contract of February 16, 1894, was at an end. The defendants upon this treated the contract as at an end, and began to sell the metal themselves. The plaintiffs thereupon sought out the defendants' customers, and informed them that they were the sole agents for the sale of Magnolia Metal in the United Kingdom, for which acts on the part of the plaintiffs the defendants now counterclaimed for damages. The case turned mainly upon the letters and telegrams passing between the parties, which were of a voluminous character.

Mr. Justice Collins, in giving judgment, said the case turned upon the contract of February 16th, 1894, by which the plaintiffs became entitled to sell the whole of the metal in England. If the contract was in existence the plaintiffs had that sole right. The defendants, on the other hand, contended that the plaintiffs had broken and repudiated the contract. There was no express agreement between plaintiffs and defendants that the defendants were to defend the action attacking the patent. It was to the interest of both parties that the patent should be defended, and the plaintiffs offered to accept drafts and receive metal on condition that the costs of the suit were paid by the defendants. It was difficult to lay one's finger upon the precise point where the plaintiffs repudiated the contract. Looking at all the circumstances of the case he came to the conclusion that the plaintiffs had repudiated the contract, and that it had determined, and the defendants were entitled to judgment.

The damages on the counter-claim were agreed at £100.

### GERMAN CHEMICAL INDUSTRY.

THE union of chemical factories, "Silesia," at Breslau, have made a net profit in 1895 of 774,362m. The articles of association of the company have been widened, so as to permit them to engage in trading and manufacturing operations of all kinds. The chemical works, "Elektron," have increased their share capital from 3,000,000m to 4,000,000m, in order to provide for the expenses connected with the working of the electrolytic-potash factory, which they are establishing in conjunction with the Westeregeln Company. The gross profit of the medicinal springs at Ober-Selters in 1895 has been 75,854'15m.; only 28,728m., however, will be divided among the shareholders, who will receive out of this a dividend of 12 per cent. The net profit of the dye-works, formerly A. Leonhardt and Co., at Mulheim-on-Maine, has been 187,637m., of which 150,000m. will be used to provide a 10 per cent. dividend for shareholders. The directors of the company state that trading last year has been less satisfactory than in 1894, the chief reason being the general decline in prices of the prepared articles, together with an increase in those of the raw materials. The total amount of sales, however, has been larger than in the preceding year. The profit of the chemical works at Buckau, in Magdeburg, has been 253,430m., against 325,021m. in the year before. The dividend is to be the same, viz., 8 per cent., and in addition to an amount of 155,739m. spent on new buildings, the factory intends to erect new works for the electrolytic manufacture of bleaching powder and caustic alkalies. The shareholders in the chemical works at Griesheim receive 16 per cent.

dividend for 1895, the same as in the preceding year. The gross profit of the factory last year was 160,104m., and it is proposed to amalgamate the factory with the chemical works "Mainthall." Ladenburg, the British Consul at Mannheim, states that for some past manufacturers have been suffering from an almost continuous of prices. Few articles have escaped the downward movement or advanced, and in these instances their exceptional position is due either to speculation or to combinations of sellers. In the case of sulphuric acid the breakdown of prices was the result of the dissolution of the South German Sulphuric Acid Convention. Keen competition between individual manufacturers at once set in, which was accentuated by impossibility of finding an extended market, owing to the comparatively high rates of freight. Artificial manure manufacturers were unable to do much business in consequence of the depressed state of agriculture, although the demand for their products has improved somewhat during the last few months, without, however, any improvement in price. The sale of chemicals for export was, on the whole, fairly maintained, and some increase of demand for the United States had occurred. On the other hand, that for Spain, which was of considerable importance in ordinary years, had all but ceased. Mr. Ladenburg reveals what probably the cause of the break-up of the South German Convention when he says that the chemical industry in Germany is being overdone. Its extension has progressed faster than the requirements of the markets which it supplies. Referring to the manufacture of chemicals, he reports that a number of newly-invented pharmaceutical products have been brought upon the market at Mannheim, some of which will doubtless prove valuable, but that there were complaints too precipitate introduction of them in a number of instances where sufficient trial of their efficacy had not been made beforehand.

### THE COST OF CALCIUM CARBIDE.

(Continued from Page 387.)

#### METHODS AND RESULTS OF CHEMICAL ANALYSIS.

THE analyses show the lime used to have been of excellent quality, except that the amount of magnesium oxide was a little greater than has been usually considered desirable for making carbide. It contained a very small amount of phosphate of calcium, as should be the case, since any phosphate is reduced in the process to phosphine, which when treated with water gives off phosphine of hydrogen, a commonly considered poisonous, and which is also probably the cause in part, of the peculiar odour of commercial acetylene.

The methods used in the analysis of the materials, both before and after mixing, were well known standard ones. The calcium was determined by double precipitation as oxalate, the magnesium as phosphate, and the carbon by treating the mixture with dilute hydrochloric acid, filtering on a Gooch crucible, drying at 110°C., and igniting at a red heat.

The analyses of the mixtures put into and withdrawn from the furnace show that the loss of material in the two trials was:—

|                     | First trial. | Second trial. |
|---------------------|--------------|---------------|
| Calcium oxide .. .. | 79.4 lbs.    | 72.4 lbs.     |
| Carbon .. ..        | 128.6 lbs.   | 80.66 lbs.    |

The greater loss of carbon in the first run was probably due to burning of the pulverized coke, either during the working of the charge or during the 13 hours which elapsed between the cessation of current and the withdrawal of the material next morning. In the second run, the contents of the furnace were gradually withdrawn almost immediately after the current was interrupted.

Much of this loss of material appears to be due to the somewhat crude methods of handling the material both inside and outside the furnaces. This has been caused by the experimental nature of the plant. A large proportion of the loss of material can probably be saved in the furnaces of improved design.

The proper sampling of the carbide mass taken from the furnace is a difficult operation, as portions selected from different parts of the mass yielded quantities of gas per pound, varying as much as half a cubic foot, while pieces taken haphazard may give results varying from 2 to 2 cubic feet, so that to obtain an absolutely accurate result, the whole mass of carbide should be taken and broken into small pieces. This did not appear to be practicable at Spray, and for the assaying of the carbide in the two runs, portions of the first mass were taken from its bottom, centre, top and sides, and placed in separate soldered cans, while of the carbide formed in the second run, 25 pounds of pieces taken from various parts of the mass were placed in one can.

These various portions were afterwards separately broken up with the hammer to the size of walnuts, then by the usual process of sampling, the amount in each case was reduced to about one-third of a pound, and the pieces to the size of beans.

Three to five analyses of each of these samples were made by weighing out about 50 grammes, immediately enclosing this quantity

paper, and placing it in a graduated glass gas bottle, closed with a three-holed rubber stopper. Through one of the holes was inserted a thermometer, through another a separating funnel, by which measured quantities of water could be allowed to enter the bottle, and through the third hole was passed a delivery tube. The gas on being generated was cooled by passing through six empty tubes surrounded with cold water, and then through a Tuff's wet meter which had been standardised the day before the determinations were begun by the Massachusetts State Inspector of Gas Meters.

The readings of the meter were taken, and the necessary corrections for the volume of water used in decomposing the carbide, the solubility of the carbide in this water, and the increase of volume of gas in the gas bottle by the elevation of temperature were made. The temperature of the water in the meter, the pressure gauge, and the height of the barometer were observed, and the corrected volumes reduced to 60 degrees Fahrenheit and a pressure of 30 inches of mercury.

The gas on analysis was found to contain only traces of phosphide, and sulphide of hydrogen. Free hydrogen could not be detected, though it has been stated that as much as 1 per cent. had been found in commercial acetylene. A test was also made for arsenide of hydrogen with a negative result.

A sample was taken of the gas given off at the top of the upper electrode, during the formation of the carbide, which, on analysis, gave by volume:—

|                       |       |
|-----------------------|-------|
| Carbon dioxide .....  | 76%   |
| Carbon monoxide ..... | 76%   |
| Nitrogen .....        | 16.4% |
|                       | 100%  |

#### COST OF CARBIDE AT SPRAY.

**COST.**—In order to determine the cost of producing carbide of calcium at the Spray works, it was necessary to arrive at the fixed charges on the plant, as well as at the cost of material and labour involved.

The Spray works are not worked steadily at their best commercial capability; and, having been evolved under experimental conditions, are not adapted to the most economical production of calcium carbide. We may assume, however, that the plant is run steadily at its full capacity, and with the performance developed during the runs witnessed, the output may be taken at 2,000 pounds of gross carbide per day.

The cost of water-power is \$5 per horse-power year at the turbine shaft. Taking the efficiency of the alternators as 88 per cent., and of the transformers as 95 per cent., the net efficiency of the electric plant is 83.6 per cent., making the cost of an electric H.P. at the furnace terminals \$5.98. The mean power employed at the switchboard being 103.2 H.P., that generated at the turbine shaft is 230.9 H.P. Adding to the power supplied to crusher, mixer and shafting, 15 H.P., the total power at the turbine shaft is 245.9 H.P., for which the annual cost is \$1,229.50.

#### COST OF THE MANUFACTURING PLANT.

**COST OF PLANT.**—The exact cost of the Spray plant chargeable to the production of carbide is almost impossible to determine accurately, since much of the plant has been installed for purely experimental purposes. The following estimates, however, are based on actual costs:—

|                            |        |
|----------------------------|--------|
| Land .....                 | \$ 100 |
| Building .....             | 1,250  |
| Turbine .....              | 2,892  |
| Electric plant .....       | 6,000  |
| Counter shafting .....     | 200    |
| Crusher and mill .....     | 1,025  |
| Rolls .....                | 238    |
| Furnaces .....             | 150    |
| Equipment, tools, &c. .... | 100    |

\$11,955

|                                             |        |
|---------------------------------------------|--------|
| Labour: superintendent at \$4 per day ..... | \$4.00 |
| " three squads of men, 8 hours each....     | 7.00   |

\$11.00

Output of gross carbide in one day of 24 hours .... 2,000 lbs.

Materials, carbon for upper electrodes at 6 cents per pound .....

\$0.86

Coke from the Pocohontas Mines, Va., \$1.50 per ton

f.o.b. Cost delivered, \$4.55 per ton. Daily consumption, 2,000 pounds  $\times$  1.125 = 2,250

pounds .....

\$5.119

Lime from Carson Lime Company, of Riverton, Va.,

about \$1.75 per ton f.o.b.; average cost delivered, \$6.30 per ton. Daily consumption, 2,000 lbs  $\times$

1.335 = 2,670 pounds.....

\$8.411

\$14.390

|                                                                  |         |
|------------------------------------------------------------------|---------|
| Materials per day and per ton of gross carbide .....             | \$14.39 |
| Labour, per day and per ton of gross carbide.....                | 11.00   |
| Water power, 1,229 $\times$ $\frac{5}{100}$ .....                | 3.37    |
| Petty stores, waste, &c., \$1.50 per annum .....                 | 0.41    |
| Taxes, at \$100 per annum.....                                   | 0.274   |
| Interest on investment at 5%, \$11,955 .....                     | 1.638   |
| Depreciation and repairs, 5% on electric plant and turbine ..... | 1.218   |
| 6% on countershafting, building, rolls, and crusher ..           | .446    |
| 20% on furnaces.....                                             | 0.21    |

\$32.767

Our estimate, therefore, of the cost of producing calcium carbide at Spray, by working the furnaces 365 days a year and 24 hours a day, yielding on the average one ton of 2,000 pounds gross carbide a day, is \$32.767 per ton. Of this amount, \$14.39 is for material. The freight charges on lime and coke are heavy at Spray, and add materially to the cost.

The nett carbide in our tests gave an average yield of 4.926 cubic feet of moist acetylene gas per pound, making an average yield of 4.696 cubic feet of moist acetylene per pound of gross carbide. Pure calcium carbide should yield theoretically approximately 6 cubic feet of gas per pound, when saturated with aqueous vapour at 60° Fahrenheit, so that the nett carbide averaged only 82.1%, and the gross carbide only 78.26% of the theoretical yield. The acetylene yielded, however, was practically pure.

In conclusion, we desire to express our thanks to Major J. T. Morehead for his courtesy in placing his entire plant at our disposal during our tests and for his aid in the investigation; as also for that of Dr. G. de Chalmot, the chemist in charge.

(To be continued.)

## Correspondence.

### ANALYSTS AND ADVERTISING.

(To the Editor of the Chemical Trade Journal.)

SIR,—Reading in an agricultural contemporary the advertisement of a chemist, in which the fees for butter and milk analyses are respectively set down at 5s. and 3s. 6d., I think there is some need to enter a protest against the course of the Institute of Chemistry in seeking to induce its members to abstain from advertising.

Taking a common sense view of the question, there is no disguising the fact that outsiders gain the direct advantage in making themselves prominent before the public, whilst under the ban of so-called etiquette the members of the Institute are asked to preserve themselves as unknown chemists. Why this? Is the Institute going to provide its members with appointments or practices?

Looking more closely at the question, the majority of the members are work's chemists, having no need to advertise, neither have public analysts, but in the case of analysts practising professionally in the strict sense, the matter is widely different, and the question of advertising becomes of serious import.

The rewards of a chemist thus pursuing his profession depends largely upon the call in supplementary services as a "skilled specialist," therefore firms require to know this individual, but the Institute says that it is discreditable for this chemist to let the firms know of his existence; for that is exactly what the ban means.

It is to the best interests of trade that "analytical specialists" should advertise themselves, because those who have not penetratively studied and practised particular analyses, cannot possibly put the manufacturer in the best position in analytical work.

I have seen many instances of this in the analyses of fertilizers, crude determinations of phosphoric acid being issued, and which, in point of fact, are but traps for the trade to pay for in deficiencies that are afterwards shown in the hands of a "real specialist."

Some years ago I suggested to the secretary of the Institute that it should identify its specialists, and issue a circular list of the members to the firms. Consideration was promised, but the matter ended with the promise.

I would add that the Institute can have no legal power over its members on the question of advertising, as no such power exists in the Incorporated Law Society. The free-born right of every Englishman to advertise is still intact and likely to be so. It is merely a question of usage, but such a thing is quite inconsistent in the analytical profession, the circumstances of practice being widely different.—Yours, &c.,

ALFRED FIRBY, F.I.C.,

10, Infirmary-street, Leeds.

## Trade Notes.

**PETROLEUM FATALITY.**—Last week a little boy named Clarke, living in South Molton-street, Plymouth, was burnt to death through a petroleum lamp overturning.

**PERSONAL.**—The will of Mr. John Clarkson Major, the well-known chemical manufacturer of Wolverhampton, who died on December 21st last, has just been proved. The personality is sworn at £56,414. gross and £49,983. net.

**AMELIA NITRATE DEBENTURES.**—It is announced that the debentures of the issue of £250,000. five-and-a-half per cent. first mortgage debentures of the Amelia Nitrate Company, Ltd., will be ready for delivery on July 1st next, at the counting house of Messrs. J. Henry Schröder and Co., in exchange for the script certificates.

**COCOA DRYING MACHINERY.**—A great deal of attention has been given in recent years in Dutch Guiana to cocoa-drying machinery. Various systems have been tried experimentally. A manufacturer with a good, simple, and economical system might find some buyers in the market.

**THE KELVIN JUBILEE.**—The first of the series of functions in celebration of the jubilee of Lord Kelvin as Professor of Natural Philosophy in the University of Glasgow was held last Monday night. It took the form of a conversazione in the College buildings, Gilmore-hill, Glasgow. There was a brilliant assemblage, including distinguished visitors from all parts of the world. The company were received by the members of the Senate of the University and the Lord Provost and magistrates. Lord and Lady Kelvin were seated on a dais in the spacious Bute-hall, and received the congratulations of the numerous guests. A special feature of the Conversazione was an exhibition of Lord Kelvin's principal inventions in various departments of applied science.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Benzol is firm at 2s. 9d. for prompt 90's, and 2s. 8d. July-December; 50.90's 2s. 4½d. prompt, and 2s. 3d. forward. Other products are about back to their former level, with crude (60%) carbolic at 2s. 2d.; crystals (40%) 7d. Solvent naphtha is quoted 1s. 3d. and crude 8d. Pitch 32s. to 32s. 6d., f.o.b., East Coast.

Sulphate of ammonia remains dull, and prices show no improvement. There is very little offering, so that buyers are more willing to take what parcels are obtainable. London outside makes are quoted £8. 2s. 6d., Liverpool £8. 2s. 6d., Hull £8., and Leith £7. 17s. 6d., all prompt.

### MISCELLANEOUS CHEMICAL MARKET.

In the alkali trade business doing is only moderate in quantity, and prices, generally, are unchanged. Alkali, 58%, remains at £3 7s. 6d., bags, f.o.r., makers' works. Leblanc ash, 1d. to 1¼d. in casks, f.o.b. For caustic soda there is an average amount of business doing, and prices remain at former quotations, viz.:—F.o.b. Liverpool, 77%, £9. 7s. 6d.; 74%, £8. 7s. 6d.; 70%, £7. 7s. 6d.; 60%, £6. 7s. 6d. per ton, 10-ton lots and upwards. Liquid caustic soda is finding more general outlet for home trade, at £4. for 90° Tw., f.o.r., makers' works. Bicarbonate steady, and in good request, at £6. 10s., f.o.b. Soda crystals quiet at 35s., bags, f.o.r. For bleaching powder there is only moderate inquiry—price, £6. 15s., f.o.r., and £6. 15s. to £7., f.o.b. Recovered sulphur firmer, at £3. 15s., f.o.r., makers' works. Chlorates of potash and soda unchanged, at 4½d. and 6d. per lb. respectively. Brown acetate of lime, £4. c.i.f., with little demand. White powdered arsenic remains firm, £23. to £23. 10s. spot delivery, f.o.r., Garston. Sulphate of copper lower, £17. 15s. to £18., f.o.b. For aniline oil and salt prices have considerably advanced; pure salt now quoted at 8d., and oil 8¼d. per lb. Nitrate of soda steady, at 8s. per cwt. Potash, caustic, and carbonate continue in good request, and prices are unchanged. Yellow prussiate of potash, 6¼d. to 7d. per lb.

### THE METAL MARKETS.

**LONDON, WEDNESDAY.**—Pig iron, dull: Scotch warrants closed at 46s. 6d.; Middlesbrough, 37s. 4d. cash, and hematite, 47s. 4½d. Copper, weak: Chili bars, G.O.B.'s and G.M.B.'s, closed at £49. to £49. 5s. cash, and £49. 1s. 3d. to £49. 6s. 3d. three months. Tin, steady: Straits closed at £60. 15s. to £61. 5s. cash, and £61. 5s. to £61. 15s. three months; Australian, £62. 5s. English ingots, £65. Lead, steady: Spanish, £10. 18s. 9d. to £11.; English, £11. 2s. 6d.; Silesian spelter, ordinary, £18. 5s. Nickel, 1s. 2d. Antimony, £30. 5s. Quicksilver: First hands, £6. 10s.;

second hands, £6. 9s. Copper shares, dull: Cape, 2½ to 2¾; Copiapo, 2½ to 2¾; Libiola, 2½ to 3½; Mason and Barry, 3½ to 3¾; Rio Tinto, 24½ to 24¾; Thaisis, 5½ to 6½.

**GLASGOW, WEDNESDAY.**—Market flat, with small business. Scotch done at 46s. 6½d. and 46s. 5½d. cash, also at 46s. 7½d. and 46s. 7d. one month; closing with buyers at 46s. 6d. cash, sellers ask 46s. 6½d. Cleveland closes with buyers at 37s. 4d. cash, sellers ask 37s. 5d. Cumberland hematite done at 47s. 4½d. cash; closing with buyers at 47s. 4½d. cash, sellers ask 47s. 5d. Middlesbrough hematite closes with buyers at 44s. 8d. cash, sellers ask 44s. 10½d.

### WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

After despatch of report last week, sulphate of ammonia took unmistakably to the down grade, and by the close of the week £7. 7s. 6d. prompt had been taken. This is now the price, but there is very little passing, and news from the continent is not of a nature to assist recovery. Forward business is talked of at about 10s. higher, but no actual business at that or any other figure has transpired. Reports as to the ordinary chemicals are slightly more favourable. Prices mostly unaltered, but a little firmer in tone. Mineral oils and paraffins are unchanged, and as before very slow of movement, this being the usual dead time of the season. Reports of enlarged petroleum production in America, by the discovery of new fields, may, if confirmed, affect the price of the native burning oil in the downward direction. This would be very bad for the industry.

Chief prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; soda ash, 48/52°, £4. to £4. 15s. nett, Tyne; white alkali, 48/52°, £4. 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett, Glasgow; caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62° £6. 7s. 6d., and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching powder, £6. 17s. 6d. nett, Tyne; saltcake, 23s. 6d.; borax, English, refined, £20., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, 5-cwt. casks, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; bichromate of potash, 4½d. nett, for Scotch and English deliveries (for export, 4½d. nett, f.o.b. Glasgow); bichromate of soda, 3¾d. nett, for Scotch and English deliveries (for export, 3½d. nett, f.o.b. Glasgow); chlorate of potash, 4½d. less 5%, any port; nitrate of soda, 7s. 10½d. to 8s. 1½d.; sulphate of ammonia, £7 17s. 6d. prompt, f.o.b., Leith; sal-ammoniac, first and second white, £37. and £35. nett, any port; sulphate of copper, £19. less 5%, Liverpool; paraffin scale, hard, 1½d. to 1¾d., and soft, 1¾d. to 2d. per lb.; paraffin wax, 120° semi-refined, 2½d. to 2¾d. per lb.; paraffin spirit (naphtha), 7d. per gallon; paraffin oil (burning) No. 1, 6¼d., and crystal, 6½d., at Glasgow and other big centres, for Scotch buyers (English sales ½d. to ¾d. lower); ditto (lubricating) 865° £4. 10s. to £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were nil.

### TYNE CHEMICAL REPORT.

TUESDAY.

There is no alteration to report in the chemical market. Business is quiet, with only a moderate demand. Soda crystals, £2. 2s. 6d. per ton, gross weight, locally. Sulphur rather scarcer at £3. 17s. 6d. per ton. Other quotations as under:—

Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £3. 17s. 6d. per ton, nett; soda ash, 48%, £4. per ton, nett; do., 50%, £4. 3s. 4d. per ton, nett; do., 52%, £4. 6s. 8d. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s. per ton, nett; do., 90/95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

**SALT.**—South Durham salt firm at 9s. per ton, f.o.b. Tees.

**COALS.**—With the exception of a better inquiry for steam coals, the market remains in much the same position. House, gas, and bunker coals are quiet, and in poor demand. Coke continues in good consumption, and firm at 15s. and 16s. per ton. Best Northumbrian steam, 8s. 6d. to 8s. 9d. per ton; second qualities, steam, 7s. 6d. to 7s. 9d. per ton; small steam, 3s. 9d. to 4s. per ton; gas coals, 6s. 3d. to 6s. 6d. per ton; bunker coals, unscreened, 6s. 3d. to 6s. 6d.; coke firm, 15s. 6d. to 16s. per ton.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

**OILS.**—Palm oil is very steady, and there is only a limited quantity offering. Business is rather slow in consequence. Olive is firm, with a moderate inquiry. Prices range from £28. to £35. per tun, according to quality. Linseed is rather quiet. Liverpool makes in export casks are quoted 19s. to 20s. per cwt. Cottonseed is steady, without anything fresh to report. Liverpool refined still stands at 16s. 3d. to 17s., and American, 16s. 9d. to 17s. per cwt. Castor oil is firm, with plenty doing on spot in good seconds Calcutta at 2½d., while first pressure French is moving well at 2½d. per lb. Tallow is in very small demand, holders being firm at recent values. Res'n continues as firm as ever, but the level of prices is beginning to tell on the demand. Spirits of turpentine are easier, spot value now being 20s. 6d. to 20s. 9d. per cwt. Petroleum, quiet: American, 6½d. to 7½d., and Russian refined 5½d. per gallon.

**COLOURS.**—Prices are steady, and practically without change. Ochres: Oxfordshire, common, £10., medium, £12., best, £15. Derbyshire, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 90s., seconds, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s.; French, J.C., 65s. Umber: 40s. to 45s. White lead, £16. Red lead unchanged. Venetian red, £6. to £10. Cobalt: Prepared oxide, 9s. 9d.; black, 9s.; blue, 6s. Oxide of iron: Common, £7.; medium, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## REPORT ON MANURE MATERIAL.

The manure season may be considered as now at an end, and, it is to be feared, it cannot be considered to have been altogether satisfactory. The promises of early spring have not been fulfilled from a manufacturers' point of view, and the dry weather of the past two months has no doubt been largely responsible for the falling off. The increased use of nitrate of soda and sulphate of ammonia has, too, been prejudicial to the interests of manure manufacturers; so that in the aggregate it will be found that large stocks of manures and material will have to be carried forward, and, as a consequence, there is no great haste to avail of the exceptionally low prices now current of all descriptions of material. The quotations for mineral phosphates are unchanged, but it is reported that further sales of South Carolina rock have been made at 5d. per unit, c.i.f., good United Kingdom ports. There is nothing fresh to report in River Plate bones. The market for Bombay bone meal remains firm, and there would be buyers of June-July shipments at £3. 12s. 6d., ex quay, Liverpool. For August-September shipment £3. 15s. per ton is required, but so far buyers will not pay the price. Prices asked for crushed Kurrachee bones preclude business. Nitrate of soda is weak, at 7s. 9d. per cwt for ordinary, and 7s. 10½d. for refined quality. There is nothing special to report in miscellaneous material, this being for the most part neglected.

## HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

The demand does not keep pace with the supply, consequently values in both linseed and cotton oils continue falling. The seed-crushing mills are, many of them, closed or working short time. The import of linseed during the week has been 14 559 quarters, viz., Buenos Ayres, 13,246 quarters; St. Petersburg, 1,150 quarters; Riga, 150 quarters; and Harlingen, 13 quarters. Linseed oil is about 7s. 6d. per ton lower on the spot, 16s. 10½d. naked having been accepted; July-August offer at 17s. 4½d., and 17s. 6d. taken for September-December; January-April, 17s. 9d.; boiled and refined, £1. to £2. per ton extra. Export for the week, 2,820 cwt. The import of cottonseed during the week has been 4,350 tons, viz., from Alexandria. Refined cotton oil is flat, 14s. 1½d., naked, having been accepted on the spot; July-August quoted, 14s. 4½d.; and November-April, 14s. 10½d.; casks £1. and ordinary barrels 30s. per ton extra. Export of refined oil for the week, 5,300 cwt. American Turpentine, 22s. 3d. per cwt. Castor oil, 2½d. per lb. for first pressure, and firm thereat. Olive oil quiet. Cod oil, £17. to £19. per ton. Herring oil, £14. Brown wool grease, £8. per ton. Boiled siccative oil, £12. per ton. American cotton oil soap, 70% fatty acids, £10. 5s. per ton. Locomotive Grease, £10. 10s. per ton.

**CAKES.**—Linseed cakes steady: 95% pure, £5. 10s.; Russians, £5. 7s. 6d.; Americans, £5. Oilcakes, £4. 15s. per ton. Cotton cakes unchanged: Best makes, £3. 17s. 6d.; seconds, £3. 12s. 6d. Black Sea rape cakes, £2. 5s. per ton.

**PAINTS.**—Makers continue active, supplying the demands of the home market, with some inquiries for abroad. White and red lead in good demand, and prices unchanged. Dry mineral colours, £3. 10s. to £8. Ultramarines, 3d. to 8d. per lb. Black blue, red oxide, venetian red,

Brunswick greens and yellow ochre paints from £11. per ton. Ready mixed paints, best brands, in good demand, from £24. per ton. Paint remover, 25s. per cwt. Imperial black varnish in good demand, and quoted £5. 10s. per ton., in batrels. Oak varnish, from 5s. 6d. per gallon.

## New Companies.

**Commercial Ozone Syndicat, Ltd.**—CAPITAL £20,000, in shares of £1. each. This company has been formed to purchase certain patents from G. V. Yarnold, and to trade as metallurgists, smelters, distillers, wax chandlers, and bleachers. The subscribers to the memorandum of association are:—C. P. Bennett, 27, Lombard-street, E.C., merchant; J. Cruddas, Holmwood, Brentwood, engineer; W. J. Engledue, Petersham-place Byfleet, colonel, retired; W. D. Gooch, 2, Willes-road, N.W., C.E.; G. Hume, 22, Budge-row, E.C., director of companies; H. E. A. Johnson, 48, The Gardens, Peckham Rye, gentleman; F. Rushton, 14, New Inn, Strand, solicitor.

**Marico (Transvaal) Saltpetre Co., Ltd.**—CAPITAL £125,000. This company has been formed to acquire mining rights and to develop mines in Marico District, South Africa. The subscribers to the memorandum of association are:—H. E. McCardle, 35, Highbury Crescent West, N., clerk; J. K. White, 60, Haymarket, S.W., solicitor; E. T. Johnson, 25, Whiteley-road, Upper Norwood, gentleman; R. E. Smith, 62, Willoughby-lane, Tottenham, clerk; E. W. Clements, 52, Queen Victoria street, E.C., clerk; H. de Montan, 54, Lordship-lane, Wood Green, engineer; W. Day, 52, Queen Victoria-street, E.C., accountant.

**Red Cross Germicide Co., Ltd.**—CAPITAL £20,000, in shares of £1. each. This company has been formed to trade as manufacturers of disinfecting and antiseptic products, distillers, chemists, and perfumers. The subscribers to the memorandum of association are:—S. Hardy, Eldon Buildings, Eldon-street, E.C., gentleman; E. C. Powell, 7, Selwood Place, Onslow Gardens, S.W., accountant; J. H. H. Garbutt, 95, The Rye, Peckham, clerk; C. F. Richardson, 123, Mount View-road, Strood Green, C.A.; W. F. Fowle, 3, St. James's-road, Stratford, E., accountant; T. G. Warner, Kingsclere, Walton-on-Thames, merchant; S. Wesley, 60, Watling-street, E.C., gentleman.

**Hermite International Electric Sanitation Co., Ltd.**—CAPITAL £300,000, in shares of £1 each. This company has been formed to adopt an agreement between Messrs Hermite, Patterson, and Cooper, to work the Hermite patents for electrolytic bleaching, sewage purification, &c. The subscribers to the memorandum of association are:—E. Hermite, 68, Victoria-street, S.W., electrical engineer; C. F. Cooper, 68, Victoria-street, S.W., C.E.; F. D. Cooper, 29, Gracechurch-street, E.C., merchant; S. Castle, 14, Southampton-street, Bloomsbury, solicitor; H. W. Kirby, F.C.A., 19, Birch-lane, E.C.; G. D. Craven, 28, Fenchurch-street, E.C., tea broker; A. E. Cooper, Norbiton Lodge, Kingston-on-Thames, chemist.

**Hoyle, Robson, Barnett, and Co., Ltd.**—CAPITAL £40,000, in shares of £10 each. This company has been formed to acquire the business of Messrs. E. and F. Barnett, at Newcastle-on-Tyne and Gateshead, and to trade as manufacturers of and dealers in paints, colours, varnishes, oils, tar, pitch, and resin. The subscribers to the memorandum of association are:—E. G. Barnett, Stockfield, Northumberland, manufacturer; F. P. Barnett & Co., Stockfield, Northumberland, manufacturers; Mrs. A. Barnett, Stockfield, Northumberland; W. Barnett, King's Royal Rifle Corps, Newcastle, lieutenant; G. Sneath, 3, St. Paul's Terrace, Newcastle, manager; W. T. Atkin, 9, Manor-road, Sidcup, Kent, agent; W. Henderson, Cromwell-road, Bill Quay-on-Tyne, manager.

**P. H. Muntz and Co., Ltd.**—CAPITAL £45,000, in £10 shares. This company has been formed to acquire the business of P. H. Muntz and Co., West Bromwich, and to trade as metal rollers, refiners, &c. The subscribers to the memorandum of association are:—P. M. Muntz, Surbiton, manufacturer; R. W. Rucker, 85, Gracechurch-street, E.C., merchant; F. C. Milford, 85, Gracechurch-street, E.C., broker; G. A. Davis, 8, Leadenhall-street, E.C., merchant; H. Attlee, 10, Billiter-square, E.C., solicitor; E. W. Reems, 85, Gracechurch-street, E.C., clerk; W. H. Rogers, 85, Gracechurch-street, E.C., clerk.

**Singer Soap, Ltd.**—CAPITAL £10,000., in £1. shares. This company has been formed to manufacture and sell soaps, tallow, glycerine, candles, oils, starch, &c. The subscribers to the memorandum of association are:—G. Singer, 33, Victoria Grove, Birmingham, tailor; E. T. Baker, Rotton Park-road, Birmingham, manufacturer; P. W. Cawley, Barford-road, Birmingham, clerk; G. Bowdon, 8, Soho-street, Smethwick, architect; Mrs. E. Bowdon, 8, Soho-street, Smethwick; B. H. Trotman, City-road, Birmingham, art master; W. C. Gelbard, Oliver-road, Birmingham, cashier; Mrs. F. Gebhard, Oliver-road, Birmingham.

## IMPORTS OF CHEMICAL PRODUCTS

AT  
THE PRINCIPAL PORTS OF THE UNITED KINGDOM.

LONDON.

*Week ending June 6th.*

## LATE ADVERTISEMENTS.

**SOAP BOILER** Wants Situation, well up in hard and soft domestic Soaps; also Toilet. Eight years reference from one maker. Address, "SOAP," *Chemical Trade Journal* Office, Manchester.

**PLANT FOR CARBONIZING.**—Wanted Prices and Particulars of Plant for converting Barytes into the Sulphide by calcining with coal.—Address, "BARYTES," *Chemical Trade Journal* Office, Manchester.

## Notices.

All communications for the *Chemical Trade Journal* should be addressed, and Cheques and Post Office Orders made payable to—

**DAVIS BROS., 32, Blackfriars Street, MANCHESTER**

Our Registered Telegraphic Address is—

"Expert, Manchester."

NATIONAL TELEPHONE 3060.

The Terms of Subscription, commencing at any date, to the *Chemical Trade Journal*,—payable in advance,—including postage on any part of the world, are as follows:—

|                                |          |
|--------------------------------|----------|
| Yearly (52 numbers) .....      | 12s. 6d. |
| Half-Yearly (26 numbers) ..... | 6s. 6d.  |
| Quarterly (13 numbers) .....   | 3s. 6d.  |

Articles, reports, and correspondence on all matters of interest to the Chemical and allied industries, home and foreign, are solicited. Correspondents should condense their matter as much as possible, write on one side only of the paper, and in all cases give the names and addresses, not necessarily for publication. Sketches should be sent on separate sheets.

## Advertisements.

Prepaid Advertisements of Situations Vacant, Premises on Sale or To be Let, Miscellaneous Wants, and Specific Articles for Sale by Private Contract are inserted in the *Chemical Trade Journal* at the following rates:—

|                                |                       |
|--------------------------------|-----------------------|
| 30 Words and under .....       | 2s. 6d. per insertion |
| Each additional 10 words ..... | 0s. 6d.               |

Advertisements of Situations Wanted are inserted at one-half the above rates when prepaid, viz.:—

|                                |                       |
|--------------------------------|-----------------------|
| 30 Words and under .....       | 1s. 6d. per insertion |
| Each additional 10 words ..... | 0s. 3d.               |

Trade Advertisements, Announcements in the Directory Columns, and all Advertisements not prepaid, are charged at the Tariff rates, which will be forwarded on application.

Advertisements intended for insertion in the current week's issue should reach the office by **Thursday morning** at the latest.

## CURRENT TOPICS.

### THE COAL CRISIS.

AN important meeting relative to the coal trade has been held this week, the outcome of which appears to foreshadow the future of the Conciliation Board. At this juncture, therefore, it will perhaps be as well to review the position of the contending parties.

The miners are very firm in their requirements. Practically they insist on the minimum wage being the present one, which is thirty per cent. above the wage ruling in 1888. On these terms they are desirous that the Board shall continue in force until 1898.

On the other hand, the masters think the Board ought to have the power to lower the minimum as now arranged by ten per cent., if the state of the trade renders it necessary. As an off-set to this concession the masters state that they will be willing to raise the maximum wage by ten per cent. This certainly sounds a fair offer, but looking at it in the light of the prospective state of trade, it is undoubtedly a rather left-handed gift.

The miners have not been slow to perceive this, and it must be admitted that the probabilities are that they are not far out in stating that the benefits held out are useless, as it is very improbable that the maximum will ever be reached, while the reduction of the minimum wage by the ten per cent. would take place very shortly.

Numerous ways of compromising matters have been hinted at as being courses that might possibly, if not probably, be acted on at Wednesday's meeting, but these need not be entered into here, as the result of the meeting speaks for itself. There was every reason to suppose that the masters were anxious to prolong the life of the Board, but the outcome of the meeting is calculated to turn opinion in the opposite direction. Though, as officially stated, the whole business done was to discuss matters and then adjourn for a fortnight, yet there are intimations that the deadlock is more uncompromising than ever, and that the adjournment may be taken as denoting the first step towards the dissolution of the Board.

### BORAX AND AMMONIA, LIMITED.

Two well-known companies have this week been candidates for honours in the company conversion line. Associated with borax we find the Redwood Chemical Works at Kennington Green and Belvedere, Kent, which were founded by the late Dr. Redwood. It appears that these works are to be amalgamated with the Pacific Coast Borax Company, of San Francisco, U.S.A. A number of properties are to be acquired, amounting in all to thirty-one thousand acres. For the production of refined borax the plant at Alameda, on San Francisco Bay, and the newly-acquired works in Kent will be employed. It is true that the word borax has a somewhat ominous ring to the ears of investors in this country since the "Harmony" company left such discord behind it. It would

seem that competition is also rife in the States, as the Pacific have been selling at a lower price so as to popularise their product. This has had a very marked effect on their profits, as between 1892 and 1895 they fell from about £89,300. to £53,571. The increase in the sales from about 7½ to 9½ million pounds during the same period tends to show that their object is being realised. The capital of the combined companies is £510,000., divided into 20,000 six per cent. cumulative shares of ten pounds each, and 31,000 ordinary shares of the same denomination.

The other company is more of the nature of a conversion pure and simple, as will be seen under the heading of "New Companies." We refer to the conversion of the business of Messrs. Forbes, Abbott, and Lennard. The change is of little interest to the investing public, but it is noteworthy to the chemical trade.

#### TARRY MATTERS.

Tar contracts seem to be very contentious things. In connection with tar, or the contracts for the same, there has been trouble lately at Bolton. In conjunction with gas liquor it has also been the centre of interest in Manchester, and now it is seemingly troubling the Salford Borough Council.

The position of the Corporation in regard to the various statements made against them is not very clear, as practically nothing definite can be ascertained. There is no doubt that changes are contemplated, and, of course, the old hands want to know the reason why. It is suggested that the contracts have not been duly advertised, but pending more precise information on this point, it is only fair to say that if it is so, it is a most singular departure from the usual course. Taking into consideration the position as a whole, it seems a pity that both sides after obtaining adequate information cannot then meet to discuss matters. There is reason to believe that if this course were pursued, there would not be a great deal left to quarrel over when the discussion came off. If there were trustworthy weapons would be to hand to fight with.

## Parliamentary Jottings.

#### STEEL RAILWAY SLEEPERS IN INDIA.

In the House of Commons last week Mr. Brigg asked the Secretary of State for India whether he had any information as to the cause of the reported failure of rolled steel sleepers in use on the Indian State railways or the other public railways in that country; and, if correct, whether such failure was confined to any particular district.

Lord G. Hamilton replied that so far as his information went there were only three cases in which the employment of steel sleepers had given unsatisfactory results. As to two, the cause was said to be the saline quality of the earth in which they were laid; and in the third case the deterioration was attributed to some defects of ballast and the method of laying.

**NEW TECHNICAL SCHOOLS FOR NORTHWICH.**—Northwich is about to be provided with technical schools at the expense of Sir Joseph Verdin, Bart. Mr. William Molyneux, of Northwich, is to be the builder, his tender of £5,800. having just been accepted. In 1890 Sir Joseph Verdin settled £27,000. to relieve cases of extreme hardship caused by subsidence in the Cheshire salt district, but on the passing of the Compensation Act the necessity for this ceased. Under a scheme sanctioned by the Charity Commissioners, Sir Joseph Verdin applied the fund to other purposes, chiefly educational. A sum of £12,000. was set apart for the provision of technical and intermediate schools and gymnasia at Winsford and Northwich. The Winsford school was built last year at a cost of about £8,000., the money in excess of the amount derived from the trust being found by Sir Joseph Verdin. It is estimated that the Northwich schools will cost £9,000., and they will be handed over to the local authorities free of encumbrance twelve months hence.

## The Patent List.

*This list is compiled from Official sources in the Manchester Technical Laboratory, under the immediate supervision of George E. Davis and Alfred R. Davis, who report professionally upon the value of Chemical Patents.*

#### APPLICATIONS FOR ENGLISH LETTERS PATENT.

- Preventing the Sickening of Mercury in Amalgamating Machines. J. T. Penny and J. Dungey. 12,519. June 8.  
Improvements in Horizontal Coke Ovens. O. Imray. 12,535. June 8.  
Apparatus for Destroying Obnoxious Fumes and Recovering Distillation Bye-products. S. G. Merrick and H. L. Washburn. 12,572. June 8.  
Improvements in Sewage Disposal. R. Johnston. 12,593. June 9.  
Universal Fuel Injector. A. Bryce. 12,628. June 9.  
Apparatus for Washing and Compressing Sulphurous Acid and other Gases. E. Porak. 12,643. June 9.  
Manufacture of Multiple Pulp Papers. W. A. Kershaw and The Medway Paper Mills Co., Ltd. 12,682. June 9.  
Waterproofing Wood, Paper, and Fabrics. S. Bennet. 12,693. June 9.  
Improved Sewage Filtering Presses. W. T. Whitehead and J. Wolstenholme. 12,735. June 10.  
Dissolving and Drying Phosphates, etc. J. Milne. 12,765. June 10.  
Apparatus for Manufacturing Producer and Water Gases. C. Whitfield. 12,771. June 10.  
Machinery for Granulating Oil Cakes, etc. J. Evans. 12,818. June 11.  
Artificial Fuel. H. Hellewell. 12,840. June 11.  
Improvements in Smoke Consumers. E. T. Thomas and Melhado. 12,868. June 11.  
Cement and Lime Kilns. W. S. Akerman. 12,889. June 11.  
Apparatus for Manufacture of Acetylene. S. Earl. 12,900. June 11.  
Apparatus for Separating and Collecting Dust. W. P. Thompson. 13,006. June 12.  
Extracting Gold. J. B. Torres. 13,034. June 13.  
Improved Manufacture of Dyes. H. R. Vidal. 13,093. June 13.  
Manufacture of Chromium and similar Alloys. E. A. G. Street. 13,117. June 13.

#### ABSTRACTS OF LATEST COMPLETE SPECIFICATIONS.

*These abstracts are specially prepared for the Chemical Trade Journal, and ALL RIGHTS of publication are RESERVED. This is the earliest series of abstracts of Chemical and allied patents accessible to the public.*

Improvements in or Relating to the Collection and Utilisation of Air-free Carbonic Acid Gas from Fermentation, and Apparatus therefor. A. J. Boulton, 323, High Holborn, London, E.C. (communicated by The Pabst Brewery Co., Milwaukee, Wisconsin, U.S.A.). Eng. Pat. 3,098. February 11, 1895.

This patent deals somewhat elaborately with a method for collecting the carbon dioxide given off during the process of brewing. There is a drawing showing the sectional elevation of a three-storey brewery and the disposition of the plant. The main feature is the arrangement by which the fermenting tubs are covered in. A sliding dome works in the tub like a gasometer. When lowered into the liquor to be fermented the whole of the air is expelled and the subsequently generated carbon dioxide collected free from air. The gas is drawn off through a suitably disposed vent, the gas being put under pressure by lowering the dome or holder. There is also a description of a plant for carbonating liquids with the carbon dioxide, so that the plant as described in detail in the specification covers the dual claims of the patent.

Process for Preventing the Chemical Action of Acids and other Corrosive Liquids on Metal Containers, Conduits, and the like. C. A. Jessen, 77, Chancery-lane London (communicated by Alf. Sinding-Larsen, 49, Huitfeldts Gade, Christiania). Eng. Pat. 12,310. June 25, 1895.

The acid resisting linings used in certain chemical operations are costly and troublesome. The inventor proposes to obviate their use entirely, and has taken advantage of the fact that the chemical action of two substances upon one another depends upon the electrical tension between them. In the case of cellulose boilers the shell is connected to one pole of a dynamo, and an axial electrode suitably supported and insulated inside the boiler is connected to the other pole. The process is not easily applicable in cases where the contamination of the product by metallic salts is objectionable. The general principle of application, apart from its special adaptability for cellulose boilers, may be stated as follows:—The metallic container is placed in an electrical circuit of like polarity, the other pole being formed by a chemically indifferent electrode immersed in the liquid in the vessel. Special care must be exercised in the regulation of the current intensity.

Improved Method for Producing Nitrides and Ammonia. H. Mehner, Savigny Platz, 5, Charlottenburg. Eng. Pat. 12,471. June 27, 1895.

Oxides of boron, silicon, magnesium, titanium, and vanadium, and similar compounds that are capable of combining with nitrogen at high temperatures are heated with coke in an electrical furnace, a current

of nitrogen or generator gas being kept passing all the time. The oxygen is attacked by the carbon, leaving the basic radicles free to combine with the nitrogen to form the nitride. A high tension current must be employed. A good deal of attention is paid to the discussion of the difficulties that stand in the way of using any source of heat other than the electric arc. If it is not possible to obtain a high tension current, a low tension can be used in certain instances. Thus, in the case of silicon nitride, if the sand is injected in a uniform jet, instead of being simply mixed previously with the coke, the desired reaction can be attained.

**Improved System for the Manufacture of Coke, the Construction of Coke Ovens, and the Recovery of Bye-products from the same.** J. T. Key, Royston, near Barnsley, and W. S. Key, Winthrop Mass, U.S.A. Eng. Pat. 10,356. May 27, 1895.

The construction of the ovens is very fully dealt with, special bricks being used and described in detail. For such *minutiae* the specification must be consulted. The leading features of the method of construction are as follows:—An ingeniously built, perforated floor allows for the downward passage of the gases, oils, &c., through which they find their way into the main outlet pipe or flue. There are also radial flues which are distributed over the bottom of the ovens, giving an even distribution when these same flues and perforations are utilised for the upward injection of steam. The perforated air blocks for admitting air to all parts of the oven are neat and handy. The steaming process is set in operation when the coke is ready to be withdrawn. It serves a double purpose, desulphurising the coke and clearing the flues and perforations in the bottom of the ovens. There are nine figures.

**Process and Apparatus for Separating and Otherwise Treating Oils and like Liquids.** G. Mitchell, 47, Victoria-street Westminster, S.W. Eng. Pat. 17,239. September 16, 1895.

The oil to be clarified is passed through a syphon, the ascending or short leg of which is provided with a water or steam jacket as the conditions may require. The short leg is fitted with a series of cone-shaped pipes, the small ends looking down into the large ends throughout the series. The oil as it undergoes the hot treatment becomes less viscid and the impurities settle into the cones, the pure oil rising to the top through the annular space between the wall of the syphon leg and the cone-shaped pipes. In the cold treatment the position of these cones is just reversed, and the oil sinks while the impurities rise and are syphoned off. In the former treatment the oil is also freed from extraneously acquired moisture. There are eight figures.

**Improvements in Varnish and in the Mode of Manufacture of the same.** E. W. Barnsley, Century Varnish Works, Western-road, Birmingham. Eng. Pat. 8,267. April 20, 1895.

The method of manufacture as described is somewhat involved and lengthy, but a superior product is claimed. Briefly, the process consists in preparing a quantity of thin amber oil and thick oil. Pale Turkey amber is boiled in well seasoned Baltic linseed oil, the temperature being kept at 450° F. After one day two-thirds are pumped out for use and constitute the thin oil. The temperature of the remaining third is raised to 550°, and not allowed to exceed 580°, and gives the thick oil. African fossil gum animi is now run down in a pot and the thin oil gradually added until the two are thoroughly amalgamated. The fire is drawn, the product thinned with genuine American turpentine, and the whole run to the store tanks. When cold add powdered magnesia and allow to stand six months. The clear portion is then drawn off and mixed with one-tenth per cent. of the thick amber oil, and powdered litharge sprinkled in. After storing for another six months at a temperature of 90° to 95° F. the varnish will be fit for sending out. The exact quantities are given.

**Improvements Relating to the Production of Cyanogen Compounds and to the Preparation of Materials for use therein.** Dr. A. Frank, 80, Libnitz-strasse, Charlottenburg, and Dr. N. Caro, 31, Calvin-strasse Berlin. Eng. Pat. 15,066. August 10, 1895.

Advantage is taken of the fact that carbides when heated to a proper temperature in the presence of steam combine with nitrogen to form cyanides. Considerable attention is paid to the preparation of the carbides employed. A modification is described in which the nitrogen acts upon the carbides of the alkaline earths in the presence of salts of the alkaline earths or alkalis, and steam. A dark red heat is the best to employ, it having been found that the lower the temperature the slower the reaction. A series of retorts connected together are necessary to obtain the best results from the nitrogen.

**A New or Improved Process for the Treatment of Aluminous Ores and Silicious Matters.** W. T. Whiteman, 7, Staple Inn, London (communicated by the Compagnie Générale d'Alumine Exploitations des Brevets F. Raynaud (Soc. Anon.), 75, Rue de Venise, Brussels). Eng. Pat. 8,072. April 16, 1896.

The invention is based upon the reaction that takes place between aluminous or silicious ore, in the presence of a sulphide capable of com-

binning with  $Al_2O_3$  or  $SiO_2$ , under the action of steam. A mixture of a sulphate and carbon answers as well as a sulphide.

Aluminate of soda is formed when bauxite and sodium sulphide are heated in a retort at a dull red heat in the presence of steam, sulphuretted hydrogen being given off. If sulphate of soda is also added the sulphur is given off as vapour and not as  $H_2S$ . The iron present in the bauxite does not interfere with the reaction. In the manufacture on the commercial scale the ore and sulphide are made into briquettes, which when treated yield, on lixiviation, a clear solution of aluminate of soda. The  $H_2S$  given off can be utilised by passing it over briquettes of aluminous ore and crushed coke heated in retorts, whereby sulphide of aluminium is formed. The presence of a little oxide of an alkali or alkaline earth assists the reaction. By adding a little sulphide of lead and a quantity of lead sulphate, and then heating to bright redness, metallic aluminium and sulphur dioxide are obtained.

## ARSENIC IN RECTIFIED VITRIOL.

By G. HATTENSAUER.

THE smallness of the amount of arsenic necessitates the employment of large quantities of vitriol. The literature of the subject is almost exclusively confined to the reactions of hydrogen sulphide and arsenious and arsenic acids or their salts. Authors note the conditions favourable to a rapid and complete precipitation of arsenic by hydrogen sulphide, but solutions of suitable acidity are supposed to be under examination. Even the instructions given in technical handbooks have been found faulty, since the dilution with water precipitates the lead incompletely as  $PbSO_4$ , and what is precipitated is most difficult to filter off. A further disadvantage is that the after treatment with hydrogen sulphide may precipitate other bases than arsenic, and the arsenic precipitate is usually a mixture of arsenic tri- and penta-sulphides with free sulphur.

All these difficulties may be avoided if use be made of the property of arsenic, of being quickly and completely precipitated from solutions containing large excess of hydrochloric acid, and if at the same time attention be given to the strength of the acid solution used for precipitation.

The author used for his experiments an acid of sp. gr. 1.815 at 22.5 deg. C. 500 c.c. of this acid were cooled and diluted with 500 c.c. of water. An acid of sp. gr. 1.46 at 15° was produced. 500 c.c. of dilute hydrochloric acid (1.2) were then added to 500 c.c. of the diluted vitriol, the cooling being continued. The author finds that a greater excess of hydrochloric acid than the above has no detrimental effect upon the after precipitation of the arsenic; still the above amount is sufficient to prevent either lead sulphate or lead sulphide from being precipitated, this prevention being the object of its addition. The liquid, which must be cooled as far as possible and kept at a low temperature, is now subjected to a rapid stream of hydrogen sulphide, continuing it at least for 45 minutes. It is better to allow an extra 15 minutes, and then the arsenic pentasulphide, which should be of brilliant yellow colour and curdy, may be immediately filtered off. The degree of dilution obtained by following the directions given above is one which leaves the filter paper unattacked by the acids. No lead was found in the washed precipitate, although the vitriol contained ten times as much lead as arsenic. The precipitate consists, according to Brauner, and Tomicek and Neber, of pure arsenic pentasulphide. The further treatment of this precipitate is carried out in the usual way, according as one desires to weigh it as the sulphide, the oxide, or as magnesium arseniate.

The author concludes by stating that, using his method, the determination of arsenic in concentrated vitriol can be completed in three to four hours, and that it is, therefore, one of the most rapid gravimetric determinations known.

**DURHAM COAL OUTPUT.**—A Blue book published recently containing the report of the inspector of mines for the Durham district during 1895, shows that the output of mineral during the year was 27,525,371 statute tons, being a decreased output of coal of 950,727 tons.

**THE CHESHIRE SALT TRADE.**—Compared with May, 1895, the shipments of white salt for the past month show a decrease of 17,478 tons. It should be remembered, however, that May of last year was the best month known for a long period, the tonnage reaching 83,012, compared with an average for the past five years of 68,299 tons. There is promise of a great improvement during the present month.

**CALCIUM CARBIDE AND MAGNESIUM NITRIDE.**—Rossel and Franck find that when calcium carbide is mixed with magnesium powder and heated over a Bunsen flame, there is at first a small flame due to the combustion of the carbon and the calcium; and then the mass glows brightly, and that the magnesium, when the operation is effected in the open air, it almost wholly converted into pure nitride of magnesium. The nitrogen of the air has thus been absorbed; and when the mass is put in water, magnesium oxide is formed while ammonia is evolved.

## EXHIBITS AT THE ROYAL SHOW.

(By SPECIAL COMMISSIONER.)

THE 57th show of the Royal Agricultural Society of England, which has been held this week at Leicester, has proved a genuine success. It is 28 years since the show was held at this town, the present being the second time that the show has been held there.

There is no need to deal further with the history of the show, and we shall proceed forthwith to those exhibits that are of interest to our readers. The fertilizing and kindred trades are well represented, as is also the agricultural machinery section. In the latter there is a great similitude in the exhibits. We shall deal first with the

## FERTILIZING SECTION.

LAWES' CHEMICAL MANURE CO. (London) have an interesting and striking stand. A feature is made of their compound fertilizers for barley and oats. Sheep dips and disinfectants are likewise a prominent feature.

JEVES' SANITARY COMPOUNDS CO. (London) have their usually attractive show of disinfectants, soaps, ointments, &c. Sheep dips are a thing to which they are giving special prominence in conjunction with the apparatus for dipping.

PERMANENT NITRATE COMMITTEE (London) have a particularly useful as well as a most interesting exhibit. The main object is to disseminate information on the proper use of nitrate of soda as a fertilizer. In addition to a number of specimens of nitrate of soda of 95% and 96% purity, the raw caliche from which it is obtained, and that most important product iodine, there are tables and blocks showing the increase in the consumption. It appears that at present France is the country that is making the most headway in this particular connection. There is also a collection of photographs, illustrating the crops grown by the aid of nitrate, and some comparative photographs indicating the difference between cabbages and similar produce grown with varying proportions of nitrate. The consumption last year was a little over one million tons.

THE SALT UNION, LTD. (Liverpool), have a stand devoted to the display of the uses of salt for agricultural purposes, dairy use, and cattle feeding. They also show a "Saltunia" soap.

THE AFRICAN OIL MILLS CO., (Liverpool), have an excellent show of feeding cakes of all kinds, and also have on view samples of oil expressed by exhibitors.

THE ANGLO-CONTINENTAL GUANO CO. (London), make a brave show of their well-known guano, sulphate of ammonia, bone manure, basic slag, kainit, besides many specially prepared compound manures.

MESSRS. S. MEGGETT AND SONS, LTD. (Mansfield, Notts), have an excellent collection of specially prepared manures for grass, turnips, wheat, mangolds, peas, beans, &c. They also show guano, feeding cakes, and general horticultural seeds. The "Victory" concentrated fertilizer is a speciality.

THE AGRICULTURAL AND HORTICULTURAL ASSOCIATION, LTD. (London), have an instructive as well as an interesting exhibit. Their great feature is the supply of pure and reliable seeds. Apart from this, however, particular attention is paid to compound cakes of the "One and All" brand, and complete fertilizers, based on scientific investigations, intended to affect the growth of full crops without undue exhaustion of the soil. Their number is great, almost every conceivable plant being provided for. Another item of interest is a table showing the principal crops, how much can be grown per acre, and their requirements, expressed in percentages of nitrogen, phosphoric acid, and potash. All the manures are sold on a guaranteed analysis.

Before leaving this section reference ought to be made to a decidedly novel exhibit, which is that of the LEICESTER BACTERIOLOGICAL INSTITUTE, which is practically identical with Dr. J. Andrew Turner. The exhibit was a most popular one, and was thronged. Pure cultures of the chief bacilli of interest to agriculturists were exhibited under the microscope. The more important were those relative to diphtheria, tuberculosis, glanders, and typhoid fever. The object of the institute is two-fold: To investigate and, by inoculation, stamp out such disease in cattle, etc., and also to provide means for the rising generation to give special attention and study to these matters in relation to stock breeding and other subjects. The exhibit was of such a novel and important character that we shall probably have more to say regarding it in a future issue.

We now come in turn to the collection of agricultural MACHINERY.

This is of necessity much the same as in previous years, but nevertheless there are several points worth mentioning. Gas engines and oil engines are as plentiful as daisies, and have already been dealt with in detail in these columns. We can now speak of them as seen at work. They all appear to work well and steadily, and among those that call for specially favourable comment are the makes of MESSRS. HOWARD AND CO., of Bedford, and MESSRS. HORNSBY AND ACKROYD, who have a portable oil engine which is very silent in operation. In

close proximity are the stands of the CAMPBELL OIL ENGINE, CROSSLEY'S, and TANGY'S, who have a pretentious but tastefully arranged exhibit. In addition to these, there were the TRUSTY OIL ENGINE CO. (Cheltenham), NATIONAL OIL AND GAS ENGINE CO. (Ashton-under-Lyne), and the "Rocket" oil engine of MESSRS. R. STEVENSON AND CO. (Newcastle). This latter appears to be a very simple engine, and we trust we shall be in a position to speak more fully of it subsequently.

THE CRANSTONE ENGINEERING WORKS, of Hemel Hempstead, have a small exhibit of paint mills and mixers, thus supporting the exhibit of MESSRS. PILCHER, LTD. (London), who have a neat display of paints in all shades ready mixed in oil or dry.

THE BLACKMAN AIR PROPELLER CO. (London) have a good exhibit of their ventilators, and also an ingenious application of the same to a heating furnace for the supply of hot-air at a constant temperature of about 190°F.

R. H. MARSDEN (Leeds) has a full and representative collection of his stone breakers and also a combined elevator and crusher.

Disintegrators were very plentiful. Taking them in the order of my visits, we come first to the CENTRAL CYCLONE CO. (London), who, in addition to their usual types, have a new pulveriser made in a small size, which only weighs 8½ cwt., their smallest size hitherto having been 23 cwt. It will thus be seen that this new type is very handy and specially suitable for grinding coal, oilcakes, and chemicals in comparatively small quantities.

THE PATENT HARDY PICK CO., LTD. (Sheffield), show their "Devil" and "Multiple" disintegrators, and were also attracting a good deal of attention with their new Vibromoter, which was at work, showing at once its simplicity and efficiency.

MESSRS. CHRISTY AND NORRIS (Chelmsford) had a well-arranged exhibit showing the products obtained by their disintegrators, and also a case containing specimens of over 150 different substances that have been successfully treated by them. Several improvements have been made in the disintegrator. The grooved side-plates have been supplanted by corrugated sides, which throw the substance being ground back into the path of the beaters. The beater arms are speedily and easily fixed. The machines are carefully balanced and fitted with automatic lubricators on the small as well as the large machines. A special feature is their new pneumatic disintegrator, which yields a very fine product. Space will not permit us to refer now to the details of this arrangement, but it certainly warrants more careful reference in a future issue.

MESSRS. TURNER AND CO. (Ipswich) have among a large collection of grinding and milling machinery a scraper and sifter, which is a neat and compact application of the Vibromoter principle to this class of work. In close proximity is the exhibit of the THOMPSON UNIVERSAL CONVEYOR. The principle on which it works is entirely different to that usually employed in conveyors, and is extremely simple. Practically speaking a rocking trough with a bottom of the same type as a mining buddle is the essential feature of the apparatus.

Mr. J. H. CARTER (Dunstable) is well in evidence with his disintegrator, which has now been so long before the public that it is not necessary to refer to it in detail. Milling machinery plays an important part in the exhibit. There is one point in connection with the disintegrator that should be noticed. This is a neat, lubricating device by which the shaft is practically kept in a bath of oil. A new purifier for Semolina Middlings, &c., is also exhibited, this apparatus having just been brought out by Mr. Carter, under the patents of Messrs. Spokes and Freeman.

STRAWSON'S, LTD. (London) make a good show with their "Strawsonite" for potato spraying, and the "Antipest" and "Nobus" spraying machines, both of these being knapsack forms. They also show larger forms of distributors.

FOLLOWS AND BATE, LTD. (Manchester), have an extensive display of grindstones and chaffcutters, but they were also pushing with success their "Economic" paint mill, as the same mill can be used to grind the dry pigments and also as a mixer. Old and dry paint and skins can be re-ground and used as primings as by a simple adjustment the conversion of the grinder into the mixer can be accomplished, the upper cone of the mill becoming oil or turpentine tight. Another interesting exhibit was a neat hand crushing mill for grinding bones, oyster shells, &c., being thus specially adapted to the requirements of poultry feeders. Among minor exhibits their "Anglo-American" and "Ideal" meat mincers should be mentioned, as they are so made that the meat is first sliced before being minced. It is impossible for any meat to reach the mincing section until it has been cut up into minute slices.

E. S. HINDLEY (Dorset) showed his well-known combined engines and dynamos, and also a collection of separate engines suitable as sources of motive power in farmyards. A double-acting pump and several smaller types formed part of the exhibit. A hand and circular saw, with special facilities in connection with the table or bench, were shown at work, the former being made to cut many fanciful and intricate shapes.

exhibits should be mentioned before concluding. These NON HOLLOWARE Co. (Bilston), who have, however, display to grindstones, and the VICTORIA PATENT STONE, who made a very presentable if not picturesque show of paving stones, sets, cobbles, drains, and such were showing several ornamental flower vases for garden

the weather has been fine, Tuesday having been a with an attendance of over 17,000.

### THE MINERAL OIL INQUIRY.

Continued sitting of this inquiry evidence was given on behalf of lamp manufacturers' trade in opposition to recommendations made to the Committee that there should be legislative restriction on the manufacture of oil lamps of alleged dangerous construction. F. Allen, managing director of Dietz, Davis, and Co., lamp makers, London, traversed statements advanced in the London County Council as to the large and increasing number of deaths arising from lamp explosions, and said the number of deaths either in proportion to the lamps in use or the deaths from other causes. He had never known an accident caused by a lamp of the construction. Even in the cheapest lamps the burner is carefully constructed, although of weaker material, as in the case of kerosene lamps. When an accident happened it might be because of the improper size for the tube, or because the lamp was not fitted to the proposed legislative restrictions, if lamps with glass reservoirs were prohibited it would utterly destroy the export trade, of which 92 per cent. consisted of lamps with glass reservoirs. It would not affect the object sought, seeing that there are millions of glass lamps in use at the present time. There is great difficulty in carrying out inspections to see whether lamps conform to the regulations laid down. Mr. J. W. Bernard, managing director of Wright and Butler, lamp manufacturers, gave evidence on behalf of the Birmingham lamp manufacturers; said that experience and inquiry had led him to the conclusion that almost all lamp accidents were due to gross carelessness. Any lamp reasonably well constructed and in current use in the country was, in his opinion, safe if used, though it was impossible to construct a lamp which would be safe in all circumstances. At the present time the trade were very fully worded statements as to how lamps should be used. These statements would be distributed over the country. He did the use of strong glass reservoirs and the raising of the flash-point from 73° to Fahr. 100°. The present flash-point was, in fact, too low for the cheap class of lamp which was mainly used in small rooms and kitchens, with often a roaring fire for ventilation, and where the temperature was frequently 80°. Oil of a flash-point of 100° would burn properly in all the lamps now in the market and would cost a gallon more than low flash oil. Mr. R. B. Evered, managing director of Evered and Company, lamp manufacturers, Mr. Shaw (president Walsall Chamber of Commerce), manufacturer, also gave evidence.

Evidence on Tuesday, Sir H. Roscoe said:—In attempting to reduce the number of accidents with lamps, there were two things to deal with—one the construction of the lamps and the composition of the oils. If everybody could employ a lamp, that was to say a lamp the use of which was free from the risk of explosion in the fount of the lamp or of fire, it would be the necessity of legislation as to the quality of the oil, so far as lamp accidents were concerned, become unnecessary, of course, for the storage and carriage of oil legislation would be required. There was a large amount of oil which was of a very volatile character, called naphtha, which whether it was used in a lamp or not would require some sort of legislative restriction. In his opinion, however, there was no such thing known as a safe lamp which could be really designated as a safety-lamp; he wished to say that in his opinion, if such a lamp did not exist, it would be possible for the legislature to insist upon its sole use. He had come to the conclusion that it was rather to the properties of the oil that they must look for an amelioration of the condition of things. He was of opinion that the danger which was in common use in this country, with ordinary care, was not dangerous. The danger was in the oils of the more volatile constituents which were the common name of naphtha or spirits; and if this was a statement of the existing condition of things it was that the higher the flash-point was—that was to say, the less the quantity of naphtha contained in the oil—the less dangerous it was. There were two dangers—the danger of an explosion of the lamp and that of fire from the oil being spilled and order to minimise the danger from explosion as well as

from fire it was advisable that the maximum temperature of the oil in the fount of a lamp which was burning should not exceed the flash-point of that oil, because in these circumstances the risk of explosion was prevented and the risk of fire was diminished. For his own information, and in order to put evidence before this Committee, he had made a series of experiments to ascertain how far the temperature of the oil in the fount in burning ordinary lamps such as were used in this country rose above the flash-point of the oil. The lamps he used were the Miller and the Duplex, and the oils the White Rose and the Tea Rose, bought in London, and the Royal Daylight, bought in Manchester. The results of the experiments showed that the maximum temperature of the oil in the fount after four hours' burning in the case of low flashing-point oils always exceeded the temperature of the flash-point (76° Fahrenheit and 83° Fahrenheit); whilst in the case of the high flashing-point oils (102° to 103°) the temperature of the oil in the fount never reached the flash-point of the oil. From these experiments he concluded that the present statutory flash-point of 73° was too low, and that it should be raised to 100° or 105°. In another experiment he found that as regards illuminating power the removal of the naphtha alone or along with a portion of what was known in commerce as the heavy end did not practically affect the illuminating power, and that the best result was obtained when 6% naphtha and 2.7% of the heavy end was removed. His experiments had been confined to American oils; but, of course, any restriction he proposed would apply equally to Russian and Scotch oils. If asked to summarise his views, he would say that the present flash-point of 73° was too low; that it was not possible to fix a flash-point so high that all danger from fire could be avoided; that if the flash-point were raised to 100°, or, better, to 105°, a considerable diminution in accidents from explosions and from fire might be confidently looked for, and that this alteration in flash-point would not materially diminish the quantity of oil imported into the country nor materially alter its price.

After Sir H. Roscoe, the Committee examined Sir D. Salomons, vice-president of the Institution of Electrical Engineers, who gave evidence as to the use of petroleum in auto-motor cars.

**GOLD PRODUCTION IN THE RAND.**—The output from the Rand district during the last month, as cabled by the Witwatersrand Chamber of Mines, amounts to 160,635 oz. This total, however, is exclusive of the returns of several companies which, under the title of the "Association of Mines of the South African Republic," give their joint output as 34,372 oz. As the Wemmer result is included in both returns, it has been deducted from the Association figures, which are thus reduced to 29,224 oz. The month's production is, therefore, 189,859 oz., and shows an increase of 18,751 oz. as compared with the previous total, and a decrease of 4,721 oz. as compared with the corresponding month of 1895.

**FAILURE OF A DRYSALTER.**—At the Manchester Bankruptcy Court, recently, before Mr. Registrar Atkinson, Mr. Frederick Victor Arden, oil merchant and drysalter, of Bull's Head Exchange Chambers, Corporation-street, was examined by the Assistant Official Receiver (Mr. A. B. Potter) as to the circumstances of his failure. The liabilities of the debtor were said to be £515, while the assets were practically nil. The debtor began business on his own account in October, 1893, at Briddon-street Oilworks, Strangeways. He was then owing £100 for private debts. These debts he paid off with some borrowed money, but he had been practically insolvent all along. The debtor was ordered to prepare further accounts, and the examination was adjourned to July 6. Mr. Rowlands appeared on the debtor's behalf.

**LANCASHIRE COAL INDUSTRY.**—Mr. Henry Hall's report on the mines under the Coal Mines Regulation Act, 1887, in the West Lancashire and North Wales inspection district was issued a week or so ago. The number of persons employed is 57,448, of whom 46,587 are males employed below ground, and 1,925 are females employed above ground. The total production of minerals is 917,300 tons less than in 1894. Lancashire (West) produced 11,993,863 tons of coal, 6,134 tons of fireclay, and 188 tons of pyrites. Denbighshire, 2,206,993 tons of coal, 46,835 tons of fireclay, and 69 tons of ironstone. Flintshire, 641,079 tons of coal, 9,568 tons of fireclay, and 917 tons of oil shale. The production of the North Wales counties shows a loss of 314,605 tons, as compared with the previous year, a proportion similar to the loss in Lancashire. The tonnage raised per person employed is less this year than last, which points to more irregular employment in 1895 than in 1894. The tonnage per person employed in 1894 was 272 tons, whereas in 1895 it is only 259 tons. The average value at the mine of the production of 1895 may be taken at about 6s. 3d. per ton, or 3d. less than in 1894. In the West Lancashire district there were 57 "separate fatal" accidents, in which 59 lives were lost, and in the North Wales district 19 separate fatal accidents resulted in the loss of 20 lives. The number of the separate non-fatal accidents in the whole district was 227, the injured numbering 241.

## Legal Intelligence.

### SUPREME COURT OF JUDICATURE.

#### COURT OF APPEAL.

(Before Lords Justices Lindley, Lopes, and Rigby.)

LANCASHIRE EXPLOSIVES CO., LTD., v. ROBURITE EXPLOSIVES CO., LTD.

The plaintiffs, who are the owners of Lumm's patent for an explosive known as Bellite, brought an action to restrain its infringement by the defendant company, who were manufacturing an explosive which the plaintiffs represented was composed of the same substance as theirs, and prepared according to the directions contained in Lumm's specification. Mr. Justice Kekewich decided at the trial that there was insufficient invention in the plaintiffs' explosive to entitle it to protection; but on appeal the Lords Justices held that the patent was good and valid. Then the defendants altered their process; but the plaintiffs, contending that it still infringed the substance of their patent, moved for an order for the committal of the directors of the defendant company for the purpose of obtaining, without bringing a new action, a judgment upon that question. On May 21st Mr. Justice Kekewich refused to commit, and this appeal was from that decision. The appellants' case was that with the exception of a small addition, which might or might not be material, the defendants were using the same ingredients as before—namely, nitrate of ammonia, and a bi- or tri-nitrate of carburetted hydrogen; but they now avoided treating the mixture to such a temperature as to enclose the nitrate of ammonia in hydro-carbon, and thus rendering it waterproof, the change making it necessary to put their explosive into waterproof cases in order to prevent it from absorbing moisture from the atmosphere. Mr. Moulton, Q.C., Mr. Terrell, Q.C., and Mr. Rubie appeared for the plaintiff company, and Mr. Cripps, Q.C., Mr. R. Wallace, Q.C., and Mr. A. B. Shaw for the Roburite Company. Their Lordships dismissed the appeal with costs, the conclusion at which they arrived being that it was an essential part of the plaintiffs' patent that the two substances should be heated to a temperature which would produce fusion, and that what the defendants were doing was not even a colourable imitation of the process described in the specification.

### SOCIETY OF CHEMICAL INDUSTRY.

#### NOTTINGHAM SECTION.

THE last meeting of the present session was held on Wednesday last week, at University College, Nottingham. A paper by Dr. Clowes on "Acetylene," illustrated by numerous experiments, was the attraction. Dr. Clowes explained how the materials necessary for the manufacture of carbide of calcium, whose action in water produces this unrivalled gas, are extremely cheap—lime and small coal or charcoal. The electric power requisite to bring about the combination is the only costly item. It is now proposed that electric light works should during the daytime utilise their plant in the manufacture of carbide of calcium, and no doubt when this is accomplished a great step will have been taken towards the general introduction of acetylene for illuminating purposes. How great its illuminating power is may be judged from the fact that a light burning five cubic feet of acetylene per hour has a power of 240 candles, whereas ethylene, one of the chief constituents of coal gas, burning at the same rate, only gives 70 candles, and methane, another constituent, reaches only the insignificant figure of 5.2 candles. The limits of explosibility when mixed with air are very wide apart, reaching from 3 to 82 per cent., thus considerably exceeding those of hydrogen of which a mixture with air must contain between 5 and 60 per cent. of this last-named gas to be explosive. The Chairman (Mr. Carulla) asked whether Dr. Clowes had had any experience with carbide containing calcium phosphide, said to be a common impurity in continental makes, which had been proved to be most dangerous, giving rise to explosions? Mr. Wood thought that with Niagara as a source of electric power there seemed to be little chance for competition in the manufacture of carbide by electric lighting companies. After some remarks by Mr. Caven and Mr. Forth, Dr. Clowes briefly replied, saying that the carbide he had recently used was certainly free from any trace of phosphide. He was hardly prepared to concur in the opinion that acetylene was perfectly safe to use with brass fittings when purified. Thanks were accorded to Dr. Clowes by acclamation for his most interesting and opportune paper. Mr. J. M. C. Paton then read a note "On the amount of air usually met with in water from ordinary sources." The proceedings terminated after an expression of hope from the chair that there might be a good muster of local members at the forthcoming annual meeting of the society in London next month.

### FATAL FIRE AT AN OIL SHOP.

A DISASTROUS fire, in which three children were suffocated, broke out early on Wednesday morning last week at an oil shop in Hackney. The premises, owned by Messrs. Davies and Evans, were occupied by a manager named Vaughan, his wife, and children. Three of the latter, aged four, nine, and thirteen, slept in the back room on the second floor, and so rapidly did the flames spread that it was impossible to reach them in time. By placing a ladder against the front room a man, who was outside when the outbreak occurred, succeeded in rescuing the wife and youngest child, while the eldest, a boy of 17, who slept in an upper story, jumped from a window. In so doing, however, he sustained such severe injuries that he died soon after at the German Hospital, Dalston. With the aid of the fire brigade the flames did not spread to the adjoining shops, the interior of the premises was completely gutted. So inflammable was the material stored on the ground floor that hardly a minute passed before the whole building was in flames. The fire broke out from some unknown cause under the staircase, where some tanks of kerosene were stored, and then it spread to the stairway, which was entirely destroyed, the flames breaking through the roof. The shop and five of six rooms were severely damaged. The building and the contents of the shop were insured.

At the inquest on Monday, some striking evidence was given which was significantly illustrative of the real dangers as revealed by science and how they are disposed of by interested parties. In answer to a question by Mr. Spencer (officer of the L.C.C.) Vaughan said that he left the oil shop at 12.15 a.m. He then walked to the canal bridge at the end of Mare-street, and he spoke to a neighbour. He fixed the time of seeing this neighbour at about 2 a.m., but he could not account for the time between 12.15 and that hour. He opened the street door by his latch-key. The witness went on to explain that the oils sold in the shop were kept in the back yard, and were conveyed to the shop by means of pipes. Pails were hung to the taps, and these pails contained several quarts of petroleum. The stock of oil was American Russian petroleum.

Mr. Spencer explained that the system of keeping pails on taps was dangerous. The shop in this instance was heated by gas, unventilated, and it was probable that the oil left in the pails had given off inflammable vapours, and thus caused the fire. The atmospheric conditions were favourable to such an occurrence.

In reply to the Coroner, Mr. Spencer said that the County Council had no control over oil shops except with regard to petroleum sold. The experience of the County Council was that in oil shop fires the only thing that was licensed entirely escaped the fire. It was so in this instance. The spirit was kept in a brick cell in the yard. The Council thought the time had arrived when they should be given greater control over oil shops. Experts had proved that when petroleum itself was heated to 73° Fahr. (which is the present legalised standard of safety, *Ed. C.T.J.*), it gave off an inflammable vapour, and if this vapour came in contact with a naked light an explosion was bound to follow.

Mr. Poley said that Mr. Spencer's conclusions were entirely disputed by Messrs. Davies and Evans. As that firm had 55 shops in London, legislative interference would affect them considerably, and he had asked that Mr. Spencer's theory should not be taken as fact.

Mr. Spencer replied that his statement could be proved by scientific evidence.

Colonel Rudd, inspector under the Petroleum Acts, said that Mare-street, was a typical London oil shop—a shop and warehouse and oil stores on the ground floor and dwelling-rooms above. Various visits witness has made to the shop he had found oil in pails under the taps.

By Mr. Poley: He had never known a fire to break out from vapour arising from oil on the premises.

Mr. Spencer: In your experience are oil shop fires usually shrouded in mystery? Witness: Yes.

The jury considered their verdict in private. When the case was reassembled it was announced they had found that the deaths were due to suffocation and burning, and that such deaths had resulted from an accidental cause. They added that there was no evidence to show how the fire originated, and they commended the fire brigade officers for their prompt appearance at the fire, and the witness Warren for the courageous manner in which he had rescued Mrs. Vaughan and one child. They also expressed sympathy with Mr. and Mrs. Vaughan in their affliction, and they added a rider, "Further powers are necessary to enable the County Council officials to regulate the storage and distribution of petroleum oils in oil shops in London."

The present Committee of Inquiry on Petroleum should note, and especially the astonishing request that Mr. Spencer's statement "should not be taken as fact," when it is proved up to the hilt by scientific evidence and daily experience. The boot should be on the other foot, we think. If Messrs. D. and E. are so ignorant, their opinions must be treated as those of ignoramus, to say nothing of

taint given to their evidence by such a reprehensible attempt to take advantage of the ignorance of the jury. Fortunately, Mr. Spencer stultified the attempt.

## THE COST OF CALCIUM CARBIDE.

SUPPLEMENTARY REPORT OF HOUSTON AND KENNELLY.

(Concluded from p. 403.)

IN the accompanying report we have stated, in conjunction with Prof Kinnicutt, the cost of producing calcium carbide electrically at the Spray works on the basis of our observations there.

As, however, the Spray works are partly experimental in their character, and freight charges on material there are heavy, we have thought it best to append a separate estimate of the cost of manufacturing calcium carbide on a more extended scale, and at a locality where the materials employed would be less expensive.

We will assume for this plant an output of 5 tons (10,000 pounds) of gross carbide of calcium per diem, and an operation of 300 days in the year by water-power.

We will assume water-power at \$5.00 per H. P. annum at the turbine shaft, including ground rent. We understand that contracts have already been entered into for limited quantities of power on this basis.

|                                                | \$13,125 per annum. |

Water-power and rent, 1,200 H. P. .... 6,000

---

\$19,125 per annum.

### MATERIALS.

|                                               |       |            |
|-----------------------------------------------|-------|------------|
| Coke delivered at \$2.75* per ton 1687 5 tons | 4,641 | per annum. |
| Lime delivered at \$2.50* per ton 2002 5 tons | 5,006 | " "        |
| Carbon for electrodes at 6 cents per pound.   | 1,290 |            |

Output 1,500 tons of gross carbide .... \$30,062 per annum.

Cost of manufacturing one ton of 2,000-pounds gross carbide ..... \$20.040

The cost of producing calcium carbide electrically is evidently limited by the cost of lime, coke, and electric power, no matter what the scale upon which the process is conducted.

If we assume a perfect electric furnace in which neither material nor energy is wasted, that is, a furnace which ensures the complete union of calcium and carbon without loss, and with no escape of heat in the process, we know that one ton of carbide would require for its production 0.875 ton of pure lime, and 0.562 ton of pure coke.

It has also been calculated from thermo-chemical data that 1½ electrical horse-power hours will be almost precisely the right amount of energy to produce one pound of carbide, or 3,000 H. P. hours per short ton of carbide.

Consequently if L is the cost of lime in dollars per ton, C the cost of coke in dollars per ton, and P the cost of an electric horse-power hour in dollars, a theoretically perfect plant would yield carbide at a cost per ton, exclusive of labour and fixed charges, of

$$0.875 L + 0.5625 C + 3000 P.$$

For example, if lime (assumed pure) costs \$2.50 per short ton, coke

\* These prices will vary at different localities. They are here given for very favourable conditions.

(assumed pure) costs \$2.75 per short ton, and an electrical horse-power of 300 working days of 24 hours each, cost \$12 at furnace terminals (0.1667 cent. per working H. P. hour), the limiting cost of carbide in a perfect furnace would be

$0.875 \times 2.5 + 0.5625 \times 2.75 + 3000 \times 0.001667 = \$8.734$  per short ton. On the other hand, in the two runs witnessed by us at Spray, the short ton of gross carbide required 1.125 tons of coke, 1.335 tons of lime, and 5122 H. P. hours. The limiting cost of gross carbide per short ton, if produced under the conditions witnessed at Spray would therefore be

$$1.335 L + 1.125 C + 5122 P.$$

With lime (assumed pure) at \$2.50 per short ton, coke (assumed pure) at \$2.75 per short ton, an electric horse-power at furnace \$12.00 per annum (0.1667 cent per H. P. hour), we have for the cost of material and power,

$$1.3335 \times 2.50 + 1.125 \times 2.75 + 5122 \times 0.001667 = \$14.960.$$

In addition the cost of electrode carbon is about 90 cents per ton of carbide produced, bringing the cost of material and power at these figures and at the Spray development to \$15.87 per ton.

We may therefore summarize as follows:—

Calcium carbide by the electric furnace cannot be manufactured cheaper than 0.875 L + 0.5625 C + 3000 P dollars per short gross ton for material and power, irrespective of electrode carbons, labour, depreciation, interest, and other fixed charges. At reasonable minimum values for L, C, and P, this amounts approximately to \$8.73 per short ton.

Owing to impurity of materials and departure from theoretical perfection in the electrical furnaces we found at Spray, the actual cost of material and power, irrespective of electrode carbons, labour, depreciation, interest, and other fixed charges, is

$$1.335 L + 1.125 C + 5122 P,$$

which with the same reasonable minimum values for L, C, and P, gives \$14.97 per short gross ton.

Under favourable conditions, such as we believe can be realised in particular localities, the total cost per short gross ton in a plant whose output is five tons daily might be \$20.

Under the actual conditions existing at Spray during our tests, we find the total cost to be \$32.767 per short gross ton, if the plant were worked continuously.

## Trade Notes.

**THE BRITISH MOTOR CO.**—The British Motor Company is about to announce a further interim dividend of 30 per cent., in addition to the 10 per cent. that was paid a few weeks ago. This should have an effect upon the price of the shares now quoted at £3.

**NIGHT USE OF TRAMWAYS FOR GOODS TRAFFIC.**—The Chemical Sectional Committee of the Manchester Chamber of Commerce has had under discussion the outlines of a scheme by which the tramway system of Manchester and Salford might be utilised for industrial purposes—viz., by using them in the night time for the passage of light trains. The Committee asked that information might be obtained as to the powers of the Corporation and the Carriage Company respectively, and the attitude which these authorities would adopt towards such a scheme. The Board approved this proceeding.

**SALT SHIPMENTS IN MAY.**—There has been a considerable falling off in the exports during May, though in a couple of instances increases are noticed. There was a slight increase in the export of salt to British North America, the figures being 14,704 tons, compared with 12,189 tons in May of last year. The figures for the previous four months also show a slight increase. To Central and South America 2,290 tons were sent last month, compared with 866 tons in May, 1895, and during the previous four months 5,374 tons, against 4,759 tons in the corresponding period of 1895. In nearly every other return decreases are noted, most of them large, and amounting in the aggregate to nearly 30,000 tons during May. The returns for the previous four months do not come out so favourable. During May large decreases are recorded in the shipments to the United States, West Indies, Africa, Asia, European ports (exclusive of U.K.), and to other ports in the United Kingdom. The same may be said of the imports during the past four months of the year to the United States, Asia, and Australasia, while during that period there was an increased export to the West Indies, European ports, and to U.K. ports, the other countries showing only a slight falling off. The total exports during May were 70,839 tons compared with 95,769 tons in May, 1895, and during the first four months of this year 152,345 tons compared with 163,298 tons in the corresponding period of 1895. The shipments from Liverpool were: May, 1896, 53,216; May, 1895, 63,233 tons; first four months 1896, 120,452; same period 1895, 139,818; and from Runcorn and Weston—May, 1896, 17,623 tons; May, 1895, 32,536; first four months 1896, 31,893 tons; same period 1895, 23,486 tons.

**AN INSTITUTE OF PHYSICAL CHEMISTRY.**—On the 3rd of this month, the newly-erected institute of physical and electro-chemistry, at Göttingen, was formally opened in the presence of a large number of influential people. The director of the institute is to be Professor Nernst, the author of the text-book of physical chemistry which we reviewed in our issue of May 11th, 1895.

**CHICAGO EXHIBITION MEDALS.**—The medals and diplomas awarded to British Exhibitors at Chicago have at length been issued to H. B. M. Ambassador at Washington, and have been transmitted by him to the Foreign Office. Sir Henry Trueman Wood has been requested by the Secretary of State to undertake the duty of distributing them, and this will be done at once. All the exhibitors may expect to receive their medals within about a month from the present date. The task was undoubtedly a heavy one but the time taken in accomplishing it does not harmonise with the Americans' reputation for "go." The majority may certainly be excused if they ask "when was the Chicago Exhibition?"

**PEGAMOID: A NEW INDUSTRY.**—In its raw state pegamoid is a jelly, or rather pulp. By imposing it on cotton cloth or impregnating that material with it pegamoid can be turned to many and varied purposes—i.e., the imitation of morocco, snake, crocodile, and calf skins, window blinds, waterproof belting for engines, in place of leather for cycle fittings, boots and shoes, and book-binding, and a hundred and one other things. The most delicately coloured wall papers treated with it become washable, or if you prefer to hang your rooms with chintz or tapestry, you can sponge the cotton, woollen, or silken material down as you would do a room lined with tiles; the effect is the same, for pegamoid is waterproof. To the world in general pegamoid is a new name, but to the business community it has been known for some little time, and its qualities have been put to the test. Messrs. Eley Brothers use it for their cartridges, and have up to this date made no less than 12,000,000 cases from it. Messrs. David Moseley and Sons are applying it to cloth, it is reported, with satisfactory results, and Messrs. Rylands and Son and Messrs. W. H. Smith and Sons have entered into contracts for its use. In face of pegamoid, the old saying that there is "nothing like leather" threatens to fall into abeyance, for it promises largely to take its place both with the maker of boots and shoes, the upholsterer, and with the bookbinder and maker of fancy leather articles as well.

**THE DEE POLLUTION BILL.**—The Bill of the Chester Corporation for enlarging the existing powers for the prevention of the pollution of the river Dee, for the construction of a weir or tidal dam across the river, and for other purposes, and for empowering the borrowing of £102,000. required for the necessary works, came before the Select Committee of the House of Commons on police and sanitary regulations last week. Among the numerous opponents are the local authorities concerned whose areas drain into the Dee, the Dee Fishing Board, and the riparian owners, headed by the Duke of Westminster. Mr. Balfour Browne, Q.C., in opening the case for the bill, said its main provisions were founded upon the report of a special commission who held an inquiry and reported in 1894, and suggested remedies to obviate the pollution of the river both from above and below, which remedies, if adopted, would render the waters of the Dee as pure for drinking purposes as those of any river in the kingdom. The Police and Sanitary Committee had already passed legislation for the Mersey and Irwell, the operation of which would render the waters of the Ship Canal much purer than would otherwise have been the case. Similar powers had been given in the case of the West Riding of Yorkshire and of the Thames Conservancy. The promoters had used every means in their power to induce the sanitary authorities on the banks of the river to stop pollution but without avail. In the construction of the proposed dam or weir a fish pass of an entirely new character would be introduced, and with this and purification of the water the number of salmon in the Dee would be enormously increased.

## Market Reports.

### TAR AND AMMONIA PRODUCTS.

Tar products generally are firmer. Benzol (90's) stands at 2s. 9d. prompt, and 50/90's 2s. 4½d. Carbolic acid: crude (60%) is now 2s. 3d., and 40% crystals 7d. Crude naphtha is steady at 10d., and solvent 1s. 4d. Anthracene and creosote unaltered. Pitch firm at 32s. to 32s. 6d., f.o.b., East Coast.

Sulphate of ammonia is firmer. The market has been steady during the week, and there have been buyers for the small quantities that have been offered. There is still no quotation for Beckton, but London outside makes figure at £8. 2s. 6d., Liverpool £8. 2s. 6d., Hull £8., and Leith £8., all prompt.

### MISCELLANEOUS CHEMICAL MARKET.

Business generally during the past week has been satisfactory. Bleaching powder is rather easier in price, though the demand continues good. Caustic soda does not move as readily as sellers would like: prices are about the same, and we quote 70% £7. 7s. 6d., and 60% £6. 7s. 6d., f.o.r., makers' works. Saltcake in fair request at about 21s. 6d. per ton, rails. Chlorates of soda and potash quiet at former prices. Recovered sulphur strong and rather scarce—£3. 17s. 6d. to £4., rails, is now quoted. Acetates generally are dull—brown (lime) is still obtainable at £4. 2s. 6d., c.i.f.; grey is a little firmer at £8. Acetic acids continue offering at low rates—40% £9., 25% £6. Sugar of lead: English white £25. 10s., grey £18. 10s. White powdered arsenic still in short supply, and £22. 10s. to £23. per ton at Garston, etc., can be realized. Carbolic acids are well maintained in price, and the demand is fairly satisfactory—crude, 60%, is quoted at 2s. 3d. per gallon, and crystals, 39/40%, at 7d. per lb. Sulphocyanides sell slowly at—barium 5d., and ammonium 7d. Oxalic acid steady at 3½d. per lb. Tin crystals easier—to-day's price, 5d. and 5¼d. per lb. Sulphate of copper £18. 10s. per ton. Nitrate of soda remains unchanged, but the market is quiet—£7. 15s. to £8., according to quality is to-day's value.

### REPORT ON MANURE MATERIAL.

Business has been quiet throughout the week, and transactions have only been induced by low prices. Mineral phosphates are difficult to place. United Kingdom buyers are fairly well covered for high grade stuff, and the Continent, having some time since purchased rather freely, are now disposed to wait in regard to further supplies. Algerian phosphate, kiln dried, offers 5¼d. per unit, in cargoes c.i.f., to United Kingdom, but buyers do not respond at the price. For South Carolina river rock 5d. is now freely quoted. There is nothing fresh to report in River Plate bones, the quotation, £3. 17s. 6d., for autumn shipment being too high to suit buyers. Sellers of Bombay bone meal are firm in all positions, and it is doubtful whether under £3. 15s. would now be accepted. For shipment late in the year £3. 17s. 6d. to £4. is asked. The quotation for crushed Kurrachee bones is £4., but there is nothing doing at the price. Nitrate of soda is quiet, at 7s. 7½d. per cwt ordinary quality, and at 7s. 9d. per cwt. for refined.

### THE METAL MARKETS.

**LONDON, WEDNESDAY.**—Pig iron, firm: Scotch warrants closed at 46s. 1½d.; Middlesbrough, 37s. 2d. cash, and hematite, 47s. 0½d. Copper, steady: Chili bars, G.O.B.'s and G.M.B.'s, closed at £49. 16s. 3d. to £50. 1s. 3d. cash, and £49. 17s. 6d. to £50. 2s. 6d. three months. Tin, quiet: Straits closed at £61. 5s. to £61. 15s. cash, and £61. 15s. to £62. 5s. three months; Australian, £62. 10s. English ingots, £65. Lead, steady: Spanish, £11; English, £11. 2s. 6d.; Silesian spelter, ordinary, £18. 7s. 6d. Nickel, 1s. 2½d. Antimony, £30. to £30. 10s. Quicksilver: First hands, £6 10s; second hands, £6. 9s. Copper shares, steady: Cape, 2½ to 2½; Copiapo, 2½ to 2½; Libiola, 2½ to 3½; Mason and Barry, 3½ to 3½; Rio Tinto, 24½ to 24½; Tharsis, 5½ to 6½.

**GLASGOW, WEDNESDAY.**—Market steady, with good business. Scotch done at 46s. 2½d. and 46s. 2d. cash, also at 46s. 3½d. and 46s. 3d. one month; closing with buyers at 46s. 1½d. cash, sellers ask 46s. 2d. Cleveland done at 37s. 2½d. cash, also at 37s. 4½d. one month; closing with buyers at 37s. 2d. cash; sellers ask 37s. 3d. Cumberland hematite done at 47s. 1½d. cash, also at 47s. 4d., 47s. 3d., and 47s. 3½d. one month; closing with buyers at 47s. 0½d. cash, sellers ask 47s. 1½d. Middlesbrough hematite done at 44s. 9d., 44s. 8½d., and 44s. 9d. one month; closing with buyers at 44s. 6½d. cash, sellers ask 44s. 7½d.

### HULL PAINT, OIL, AND COLOUR REPORT.

TUESDAY.

**OILS.**—The situation here, in anticipation of the closing time of the half-year being so near, is very quiet, which makes a bad market worse; one feature in all quotations beyond June is the higher prices ruling, which leads us to believe that the end of June sees the bottom of the present decline in prices. The import of linseed during the week has been 43,788 quarters, viz., from the River Plate, 28,206 quarters; Bombay, 12,381 quarters; New York, 2,000 quarters; and St. Petersburg, 1,201 quarters. Linseed oil is steady, at 16s. 9d. per cwt. naked spot; July-August, 17s. 3d.; September-December, 17s. 4½d. to 17s. 6d.; and January-April, 17s. 7½d.; refined and boiled from £1. to £2. per ton extra. Export for the week has been 1,220 cwt.

port of cottonseed during the week has been nil. Refined cotton oil, at 14s. 1½d. naked spot; July-August, 14s. 4½d.; September-April, 14s. 10½d.; crude on the spot is quoted at 14s. 1d. and ordinary barrels 30s. per ton extra. Export of oil for the week has been 5,780 cwt. Castor oil first pressure pressed for, and firm at 2½d. per lb. American Turpentine, per cwt. Cod oil, £17. to £19. per ton. Resin continues high in value. Brown wool grease, £8. per ton. Olive oil £14. per ton. Boiled siccative oil, £12. per ton. Cotton oil soap, 70% fatty acids, £10. 5s. per ton. Locomotive oil, 10s. per ton.

LS.—The trade is very quiet. Linseed cakes quoted from £5. 10s. per ton. Cottonseed, £3. 12s. 6d. to £3. 15s.

Black Sea rape cakes, for manure purposes, £2. 2s. 6d. per ton.

FS—Manufacturers continue very busy, and feel least of all of the trade the close of the half-year. White and red lead d, and in regular demand. Dry mineral colours, £3. 10s. to 3d. to 8d. per lb. Black, blue, red oxide, venetian red, k green, and yellow ochre paints from £11. per ton. Ready tints, best brands, in good demand, from £24. per ton. Cover, 25s. per cwt. Imperial black varnish, £5. 10s. per barrels. Oak varnish, from 5s. 6d. per gallon.

## LIVERPOOL OIL AND COLOUR MARKET.

WEDNESDAY.

—Palm oil is being steadily held, and is in very short supply. Hence there is but little business doing, and that of no importance is rather better, prices being steady, with a nice little business doing. Linseed is quiet. Liverpool makes in export slightly easier, at 18s. to 20s. per cwt. Cottonseed is

Prices are steady, but, as the demand is halting, a concession can be obtained on the current values of 16s. 3d. to 17s. for refined. American is easier, at 16s. 9d. per cwt. Castor oil the best sections of the market, a healthy tone prevailing. It is very firm, at 2¾d. to 3d. for good seconds Calcutta, which is short supply. First pressure French is quoted 2½d. per lb. and is firm thereat. Tallow is still featureless, price being unaltered. Resin is steady, but prices are practically as there is next to nothing doing. Spirits of turpentine have on the retrograde, and have now settled down fairly steady, at 20s. 6d. spot. Petroleum is steady, with American, 6¼d. and Russian refined 5¾d. per gallon.

URS.—Prices are steady, and practically without change. Oxfordshire, common, £10., medium, £12., best, £15. e, common, 40s.; medium, 50s., best, 60s.; Welsh, best, 50s., and common, 18s.; Irish, Devonshire, 40s. to 45s., J.C., 65s. Umber: 40s. to 45s. White lead, £16. unchanged. Venetian red, £6. to £10. Cobalt: Prussian blue, 9s. 9d.; black, 9s.; blue, 6s. Oxide of iron: Common, £10.; finest, £20. Zinc oxide, £22. 10s. to £25.

## WEST OF SCOTLAND CHEMICALS.

GLASGOW, TUESDAY.

There are very few changes to note as regards the standard chemicals of improvement recorded last week is maintained, but no change in that, and prices for the most part are unaltered. Sulphate is the chief exception, having given way appreciably. Bicarbonate of potash and bichromate of soda are steady at the old prices. Mineral oils and paraffins are all unchanged, with a passing, the present being about the middle of the off season, and makers stocking mainly against the demands of the next American refined petroleum has been picking up in price which is so far in favour of the home industry. Sulphate of soda is a shade better at about £7. 18s. 9d., spot, Leith. For the week or two forward £8. has been got.

Prices current are:—Soda crystals, £2. 2s. 6d., nett, Tyne; 48/52°, £4. to £4. 15s. nett, Tyne; white alkali, 10s. to £5. nett, Tyne; alum in lump, £5. to £5. 5s. nett, caustic soda, white, 74° £8. 7s. 6d., 70/72° £7. 7s. 6d., 60/62°, and cream 60/62° £6. 7s. 6d., all nett, Liverpool; bleaching 6. 17s. 6d. nett, Tyne; saltcake, 23s. 6d.; borax, English, 10., and boracic acid, £30. nett, Glasgow; bicarbonate of soda, £6. 10s., and 1-cwt. casks £6. 15s. nett, Liverpool; of potash, 4½d. nett, for Scotch and English deliveries (for d. nett, f.o.b. Glasgow); bichromate of soda, 3¾d. nett, for English deliveries (for export, 3½d. nett, f.o.b. Glasgow); potash, 4½d. less 5%, any port; nitrate of soda, 7s. 9d. to sulphate of ammonia, £7. 18s. 9d. prompt, f.o.b., Leith; salt: first and second white, £37. and £35. nett, any port; copper, £17. 15s. less 5%, Liverpool; paraffin scale, hard,

1½d. to 1¾d., and soft, 1¾d. to 2d. per lb.; paraffin wax, 120° semi-refined, 2½d. to 2¾d. per lb.; paraffin spirit (naphtha), 7d. per gallon; paraffin oil (burning) No. 1, 6¼d., and crystal, 6½d., at Glasgow and other big centres, for Scotch buyers (English sales ½d. to ¾d. lower); ditto (lubricating) 865° £4. 10s. to £5., 885° £5. 10s. to £6., and 890/895° £6. to £6. 10s. Week's imports of sugar at Greenock were 26,400 bags beet unrefined, 37,101 bags jaggery unrefined, and 1,250 bags grape.

## TYNE CHEMICAL REPORT.

TUESDAY.

There is no change to report in the local chemical market, which continues quiet, with prices unaltered. Bleach is quoted at £6. 10s. and £7. 5s. per ton, according to destination. Soda crystals, £2. 2s. 6d. per ton, gross weight, locally. Sulphur scarce at £4. per ton. Other quotations as under:

Bleaching powder, softs, £7. 5s. per ton, nett; hards, £7. 10s. per ton, nett; caustic soda, 76/77%, £9. 5s. per ton, nett; do., 70%, £7. 15s. per ton, nett; recovered sulphur, 2 cwt. bags, £4. per ton, nett; soda ash, 48%, £4. per ton, nett; do., 50%, £4. 3s. 4d. per ton, nett; do., 52%, £4. 6s. 8d. per ton, nett; alkali, 36%, £2. 15s. per ton, nett; white alkali, 48%, £4. 10s. per ton, nett; do., 50%, £4. 15s. per ton, nett; do., 52%, £5. per ton, nett; hyposulphite of soda, 5-7 cwt. casks, £6. 5s. per ton, nett; do., 1 cwt. kegs, £7. per ton, nett; silicate of soda, 75° Tw., £2. 12s. 6d. per ton, nett; do., 100° Tw., £3. per ton, nett; do., 140° Tw., £3. 7s. 6d. per ton, nett; soda crystals, casks, £2. 2s. 6d. per ton, gross weight; do., 2 cwt. bags, £2. 2s. 6d. per ton, nett weight; chlorate of potash, 5d. per lb., less 6%; pearl hardening, £3. per ton, nett; pure white sulphate of alumina, £3. 17s. 6d. per ton, nett; blanc fixe, £7. 5s. per ton, nett; chloride of barium, refined crystals, £6. 15s. per ton, nett; do., 90/95%, crude calcined, £6. per ton, nett; sulphide of barium, crystals, £4. 15s. per ton, nett; carbonate of alumina, £30. per ton, nett; aluminate of soda, £30. per ton, nett.

SALT.—South Durham salt steady at 9s. and 9s. 6d. per ton, f.o.b., Tees.

COALS.—Business is only slow, as is usual just before the holidays (this being the local race week). Best steam coal in good demand, and coke steady at undermentioned quotations. Gas and household coal dull, the consumption being at its lowest point. Best Northumbrian steam, 8s. 6d. to 8s. 9d. per ton; second qualities, steam, 7s. 6d. to 7s. 9d. per ton; small steam, 3s. 9d. to 4s. per ton; gas coals, 6s. 3d. to 6s. 6d. per ton; bunker coals, unscreened, 6s. 3d. to 6s. 6d.; household coals dull at 10s. to 10s. 6d.; coke firm, 15s. 6d. to 16s. per ton.

## New Companies.

**New Transvaal Chemical Co., Ltd.**—CAPITAL £16,000., in shares of £1. each. This company has been formed to acquire the Transvaal Chemical Co., Ltd., and to trade as manufacturers and dealers in sulphuric acid and all kinds of chemicals. The subscribers to the memorandum of association are:—C. T. Perrott, Tenter-street, Moorfields, agent; W. L. Bouse, Burrock, Dundee, manufacturer; G. H. L. Bouse, St. Andrew's Buildings, Dundee, manufacturer; E. L. Bouse, 1, Links-place, Leven, Fife, spinner; W. Hunter, 19, Wellgate, Dundee, warehouseman; T. Bell, Dundee, merchant; R. A. Murray, 163, West George-street, Glasgow, C.A.

**Icke and Co., Ltd.**—CAPITAL £30,000., in £10. shares. This company has been formed to acquire the business of Messrs. Icke, Hilton, and Jones, and to trade as drysalts and chemists, &c. The subscribers to the memorandum of association are:—C. Icke, 18, Golden Hillock-road, Birmingham, confectioner; Mrs. B. Icke, 18, Golden Hillock-road, Birmingham; J. H. Hilton, 266, Stratford-road, Birmingham, confectioner; Mrs. M. Hilton, 266, Stratford-road, Birmingham; A. Jones, Albert-road, Stechford, near Birmingham, confectioner; Mrs. E. Jones, Albert-road, Stechford, near Birmingham; J. W. Icke, 99, Gt. Brook-street, Birmingham, clerk.

**Forbes, Abbott, and Lennard, Ltd.**—CAPITAL £250,000., in 5,000 preference shares of £10. each and 18,182 ordinary shares of £11. each. The company has been formed to acquire and carry on the business of tar distillers, chemical manufacturers, salt masters, &c., now being carried on at London, Shoreham, Rye, and Greenwich. The subscribers to the memorandum of association are:—J. Forbes, 70, Gracechurch-street, E.C., manufacturing chemist; J. Abbott, 70, Gracechurch-street, E.C., manufacturing chemist; F. Lennard, 70, Gracechurch-street, E.C., manufacturing chemist; F. Ince, St. Benet Chambers, Fenchurch-street, E.C., solicitor; T. G. Fletcher, St. Anne's Wharf, Limehouse, E., merchant; J. S. Field, 28, Annandale-road, Greenwich, manufacturer; W. P. Partridge, 4, Billiter-street, E.C., agent.

**Magnolia Metal Co., Ltd.**—CAPITAL £1,000., in £1. shares. Under this title a company has been formed to trade as founders and mechanical engineers.

**Rubber Exploration Co., Ltd.**—CAPITAL £200,000, in shares of £1 each. This company has been formed to carry on the business of rubber-tree growers and rubber merchants, &c. The subscribers to the memorandum of association are:—H. Evans, 1, Sutherland-road, Bow, stationer; D. Jamieson, 30, Moorgate-street, E.C., commissionaire; H. L. Rydon, Highbury New Park, N., clerk; L. Wilson, 14, Alleyn-road, Dulwich, agent; J. Collins, 15, Fleur-de-Lis-street, E., botanist; T. Miller, 19, Buckland-street, New North-road, N., clerk; and T. W. Wheeler, 30, Moorgate-street, E.C., housekeeper.

**Chloro-Cyanide Manufacturing and Gold Extraction Syndicate, Ltd.**—CAPITAL £30,000., in £1. shares. This company has been formed to acquire the patents of G. J. Atkins for the manufacture of compounds of chlorine and cyanogen with certain metals for the separation of metals from their ores. The subscribers to the memorandum of association are:—P. F. Gaunt, 19, Victoria-avenue, Upton Park, accountant; E. Applegarth, 2, Vernon Chambers, Southampton-row, engineer; H. Ince, 68, Warren-road, Leyton, bookkeeper; G. J. Atkins, 35, East Bank, Stamford Hill, chemist; W. J. Minson, 41, Aytoun-road, Stockwell, clerk; W. A. Battie, 1, Allison-road, Harringay, gentleman; J. Hassan, 13, Chaucer-road, Fore t Gate, gentleman.

## IMPORTS OF CHEMICAL PRODUCTS

AT

### THE PRINCIPAL PORTS OF THE UNITED KINGDOM

#### LONDON.

Week ending June 13th.

**Acetic Acid**—  
Holland, 100 pks. R. W. Greeff & Co.

**Acetone**—  
Germany, 12 pks. Thames S. T. & L. Co.  
Holland, 2 cks. G. Rahn & Co.

**Alkali**—  
Canada, 48 c. J. Barber & Co.

**Aluminium**—  
Belgium, £150 Krayner, Back & Co.  
" 156 Sawyer, Sons & Co.

**Antimony Ore**—  
Newcastle, N.S.W., 6 t Vivian, Younger & Co.

**Asbestos**—  
Italy, £100 London Asbestos Co.  
" 250 Imperial Asbestos Co.  
Germany, 75 T. H. Lee

" 40 T. Boorn  
" 316 Brit. Asbestos Co.  
" 550 Bender & Martin  
" 16 Craven & Co.  
Holland, 11 Philipps & Graves  
Italy, 1,200 Capt. Dundas

**Barytes**—  
Holland, 23 cks. Soundy & Sons  
Belgium, 133 W. Harrison & Co.  
Holland, 101  
" 21 O'Hara & Hoar  
Germany, 19 P. Jantzen  
Holland, 88 Taylor Biss.  
Germany, 44 W. Harrison & Co.

**Bone Meal**—  
E. Indies, 559 t Fox, Roy & Co.

**Boric Acid**—  
Italy, 9 cks. Beresford & Co.

**Camphor**—  
Germany, 100 cs. Hale & Son

**Caoutchouc**—  
E. Indies, 40 c. Ralli Biss.

Sack Holders can be adjusted to any  
size of Sack.

HOLDERS made in different sizes.

With this Machine one can do the work  
of two in filling Sacks. It is simple in con-  
struction, and not liable to get out of  
order; is easily managed, and adjustable  
to any kind of Sack. It is invaluable to  
Farmers, Seed, Grain and Potato Mer-  
chants, Oil and Coloursmen, Druggists,  
and Chemical Manufacturers, and can be  
easily carried about with ease by a lad.  
The saving of actual labour in filling  
Sacks of any material will quickly cover  
the cost of the Machine.Illustrated Price Lists on  
application.Samples may be seen at the Office  
this paper.

Central Plaster, Whiting, and Salt Depot.

Brewer Street, Port Street, Manchester, February 8th, 1896.

Messrs. J. M'DOWALL & Co.,  
230, Berkeley Street, Glasgow.DEAR SIRS,—We have been using your Sack Holder for some time now, and we find them a great labour  
saver.  
Yours Respectfully, **E. READ & SONS.**  
(A. E. READ.)**Sole Makers: J. M'DOWALL & CO., 230, Berkeley St., GLASGOW.****AGENTS WANTED****Sale by Auction.****TO MANUFACTURERS AND OTHERS.****HALE CLIFF, LANCASHIRE.****VALUABLE LAND, fronting the**River Mersey, with Sea Wall, Works, Dwelling  
House, and Cottages, suitable for the site of extensive  
Works, especially those requiring water carriage, it being  
the only available river frontage between Garston and  
Ditton, and within easy reach of the Speke and Halebank  
Stations of the London and North Western Railway, and  
the Halewood Station of the Cheshire Lines Railway.**TO BE SOLD BY AUCTION.****By Messrs. BRANCH & LEETE,**At the Law Association Rooms, 14, Cook-street, Liverpool,  
on Wednesday the 1st day of July, at 2-30 punctually.**ALL THAT PIECE OF LAND** with the Works,  
Dwelling House, and Cottages thereon, containing 7 acres,  
2 roods, 64 perches, statute measure, situate on the North  
Bank of the River Mersey, and being as to 5 acres, 1 rood,  
28 perches in the Township of Hale, and as to 2 acres,  
0 roods, 184 perches in the Township of Speke.The property has a most valuable frontage to the River  
Mersey of about 200 yards, and has for nearly all its length  
a strong stone wall on the margin of a 15-feet 6-inch tide.The Works were formerly used as Cement Works, but  
lately principally for the manufacture of artificial stone.There is a good House on the property, containing 4  
sitting-rooms and 6 bed-rooms, and all usual conveniences,  
and a 4-stall stable and coach house; Greenhouse, with  
heating apparatus; and good Garden and Orchard. There  
are also on the property, two superior Cottages in their own  
Gardens, and a block of Eight Buildings, constituting  
Eleven separate tenements, each with its own garden.That portion of the property in the Township of Hale is  
Freehold; that in the Township of Speke is Leasehold for  
1,000 years from 1776 at an annual rent of 1/-.For further particulars apply to the Auctioneers, Messrs.  
Branch & Leete, 60, Hanover-street, Liverpool; or to  
Messrs. LACES, BIRD, WILSON & TODD, Solicitors, 1,
